## Table of Contents

Acknowledgments. ..... xii
Executive Summary. ..... xiv
Section 1: Introduction ..... 1
1.1 Overview of the 2011 APNA Report ..... 1
1.2 The APNA Survey Form ..... 1
1.2.1 Development of the APNA Survey Form ..... 1
1.2.2 Content and Focus of the APNA Survey Form ..... 2
1.3 Administration Procedures ..... 4
1.3.1 Description of APNA Administration Procedures ..... 4
1.3.2 Description of Survey Scanning and Scoring Procedures ..... 5
1.4 Creation of the 2011 APNA Survey Database ..... 5
1.4.1 Survey Distribution and Processing ..... 5
1.4.2 Assessment of the Validity of the Individual Survey Protocols ..... 6
1.4.3 Survey Participants by County and Region ..... 6
1.5 Student Demographics ..... 7
Section 2: Risk and Protective Factors ..... 10
2.1 The Risk and Protective Factor Model ..... 10
2.1.1 Community Domain Risk and Protective Factors ..... 12
2.1.2 Family Domain Risk and Protective Factors ..... 17
2.1.3 School Domain Risk and Protective Factors. ..... 21
2.1.4 Peer-Individual Domain Risk and Protective Factors ..... 25
2.2 Risk and Protective Factor Results for Arkansas Students ..... 31
2.2.1 Overview of Findings from the 2011 APNA ..... 31
Section 3: Substance Use Outcomes ..... 32
3.1 Introduction to the Measurement of Substance Use Outcomes ..... 32
3.1.1 Substances and Prevalence Periods That Are Measured in the APNA Survey ..... 32
3.1.2 Comparison Groups ..... 32
3.2 Age of Initiation ..... 33
3.3 Lifetime ATOD Use. ..... 35
3.3.1 Arkansas Results Compared to National Results. ..... 35
3.3.2 2011 Results Compared to Previous Years' Results ..... 35
3.3.3 Substance Use by Gender ..... 38
3.4 Past 30-Day ATOD ..... 38
3.4.1 Arkansas Students' Substance Use Compared to National Results ..... 38
3.4.2 Arkansas Students' 30-Day Substance Use in 2011 Compared to Previous Years ..... 42
3.4.3 Past 30-Day Use by Gender ..... 42
3.5 Special Topics in Substance Use ..... 48
3.5.1 Heavy Alcohol, Cigarette, and Marijuana Use ..... 48
3.5.2 Simultaneous Use of Multiple Substances ..... 51
3.5.3 Sources of Alcohol and Location of Alcohol Use ..... 52
3.5.4 Perceived Harmfulness ..... 57
3.5.5 Intention to Use. ..... 61
3.5.6 Academic Performance and Substance Use. ..... 63
3.5.7 Depressive Symptoms and Substance Use ..... 65
Section 4: Behavioral Outcomes Other Than Substance Use ..... 67
4.1 Introduction to the Measurement of Antisocial Behavior ..... 67
4.1 Introduction to the Measurement of Antisocial Behavior ..... 71
4.2 Antisocial Behavior During the Past Year ..... 71
4.2.1 School Suspension ..... 71
4.2.2 Carrying a Handgun/Taking a Handgun to School ..... 71
4.2.3 Selling Illegal Drugs ..... 72
4.2.4 Vehicle Theft ..... 72
4.2.5 Arrest ..... 72
4.2.6 Attacking Someone With the Intention of Seriously Hurting Them ..... 72
4.2.7 Gang Involvement. ..... 73
4.3 Age of Initiation of Antisocial Behavior ..... 73
4.3.1 School Suspension ..... 73
4.3.2 Arrest ..... 73
4.3.3 Carrying a Handgun ..... 73
4.3.4 Attacking Someone with the Intent of Seriously Hurting Them ..... 73
4.3.5 Age of Initiation for Gang Involvement ..... 73
Appendices
Appendix A: Arkansas Prevention Needs Assessment 2011 Student Survey ..... 77
Appendix B: Sample Profile Report ..... 86
Appendix C: Lifetime and 30-Day ATOD Use For Participating Regions and Counties ..... 152
Appendices Available Online (http://www.arkansas.gov/dhs/dmhs/adap_survey.htm)
Appendix D. Item Dictionary for 2011 APNA Survey
Appendix E. Risk and Protective Factors and Associated Survey Scales
Appendix F. Arkansas Prevention Needs Assessment Survey Item-Level Results
Appendix G. Selected Charts for Males Compared to Females

## Acknowledgments

The 2011 Arkansas Prevention Needs Assessment (APNA) was coordinated by the Division of Behavioral Health Services, Arkansas Department of Human Services, working with International Survey Associates, dba Pride Surveys. The APNA Project was developed with federal funds from the Substance Abuse Prevention and Treatment Block Grant, Substance Abuse and Mental Health Services Administration, and the United States Department of Health and Human Services.

In addition, we wish to acknowledge the significant contributions of our previous contractor, the Southwest Prevention Center at the University of Oklahoma and its sub-contractor, Bach-Harrison.

We would like to extend our sincere appreciation to the 627 schools in the 221 Arkansas School Districts that participated in administering this survey. A special "thank you" to the students who completed the survey and their parents who supported their endeavors.

It took many individuals working together to make this effort a success, but it would be remiss for us not to give special recognition to the staff of Department of Human Services - Division of Behavorial Health Services (DHS-DBHS) Regional Prevention Resource Centers for the support and effort they contributed to the project. Appreciation is also extended to the community anti-drug coalitions who helped to increase school participation in the survey.

The 2011 survey results represent the tenth annual survey since 2002; however, due to space limitations, many of the graphic images display only the past six years of data. We hope schools and communities find the tenth year's data useful for their planning purposes. We invite ALL public schools in Arkansas to participate in the upcoming year's survey. If interested, please contact DHS-DBHS at (501) 686-9030 or your Regional Prevention Resource Center.

## Executive Summary

This report provides findings for the 2011 Arkansas Prevention Needs Assessment (APNA) Survey. The APNA, conducted annually since 2002, is administered to Arkansas' youth in grades 6, 8, 10, and 12. In November 2011, 100,371 students were surveyed, which resulted in a total of 90,468 Arkansas students, in 221 school districts, providing valid survey data (Table ES-1, Figure ES-1). Since 2002, the APNA has provided Arkansas policy makers and prevention workers with one of the primary tools for understanding Arkansas' prevention needs in the area of alcohol, tobacco, and other drugs, antisocial behavior and delinquency, school dropout and violence. The Division of Behavioral Health Services, Arkansas Department of Human Services, the sponsor of this survey, is grateful for the cooperation and support of Arkansas' students, school administrators, and teachers, in making this survey a success.

The APNA survey measures the current student use of alcohol, tobacco, and other drugs (ATOD). The substances include: 1) alcohol, 2) cigarettes, 3) smokeless tobacco, 4) marijuana, 5) hallucinogens, 6) cocaine, 7) inhalants, 8) stimulants, 9) sedatives, 10) methamphetamines, 11) ecstasy, and 12) heroin. Students' use of these drugs are compared with national data, as well as between different Arkansas regions. The APNA also measures student involvement in a broad range of antisocial behaviors including assault and gang involvement. Finally, the APNA measures the prevalence of 19 risk and 13 protective factors in students' lives.

Figure ES-1

## Arkansas Students' Age of Initiation

The APNA survey asks students when, or if ever, the student first used ATODs. As in past years, Arkansas youth begin using cigarettes earlier than any other substance (Figure ES-2). Of those youth who had used cigarettes, the average age of first use was 12.3 years. A period of about 18 months continues to separate the age of when the student reported first having more than a sip or two of alcohol and the first regular alcohol use. The first incidence of more than one sip occurs at 12.7 years, and the first regular use of alcohol at 14.2 years; this is almost no change in either category in the last five years. Of the youth who had used marijuana, the average age of first use was 13.7 years, which was the same as in the previous year and at the level reported in 2008. Age of First regular alcohol use increased very slightly from 14.1 years to 14.2 years. Comparing 2006 results to this year's survey, the largest differences occur in first cigarette use ( 12.0 years in 2006 vs. 12.3 years in 2011 ) and first marijuana use ( 13.5 in 2006 vs. 13.7 in
2011) and first alcohol more than a sip ( 12.5 in 2006 vs. 12.7 in 2011). In all cases, students are waiting longer to try these substances; this could be indicative of a positive effect of prevention programming.

## The Lifetime Prevalence of ATOD Use

Lifetime prevalence is the use of a substance at least once in the student's lifetime, and is the best measure of youth experimentation with alcohol, tobacco, and other drugs. In the 2011 APNA survey, the substances with the highest lifetime prevalence rates include: alcohol (38.2\%), alcopops ( $26.7 \%$ ), cigarettes ( $24.6 \%$ ), smokeless tobacco ( $14.1 \%$ ), marijuana (15.2\%), prescription drugs (10.1\%) and inhalants (9.9\%) (Figure ES-3). While students reported the use of these substances the most, usage rates declined from 2010 anywhere from $0.1 \%$ to $0.9 \%$, with the exception of marijuana, which increased from $14.9 \%$ to $15.2 \%$ and cocaine which increased from $1.2 \%$ to $1.3 \%$.

Compared with Monitoring the Future (MTF) survey results, which is the best measure of national trends for 8th, 10th and 12th grades, Arkansas youth have higher rates of cigarette and smokeless tobacco use (by 2.6\% to $6.9 \%$ ) than youth nationally. In contrast, Arkansas students have up to $12.5 \%$ lower rates than national youth in their use of alcohol, marijuana, hallucinogens, cocaine, methamphetamines, stimulants, ecstasy and alcopops. Sedative use, however, among Arkansas' 8th, 10th and 12th graders, is higher than the national average (by 4.8\%-7.0\%).

New in 2009, the APNA survey collected lifetime prevalence rate of alcopops and found that nearly a third ( $31.3 \%$ ) of Arkansas' survey respondents said they used alcopops; the rate decreased in 2011 to $26.7 \%$. Almost half of 12th graders reported using alcopops, almost $40 \%$ of 10 th graders and $21.1 \%$ of 8th graders said they used alcopops. There are no national findings for comparisons on this substance.

Figure ES-2
Average Age of First Substance Use
(of Students Who Indicated That They Had Used)

Figure ES-3
Lifetime ATOD Use:
Arkansas (2006 thru 2011) Compared to National (2011)

MTF=Monitoring the Future, a national survey of 8th, 10th and 12th graders.

Figure ES-4
Lifetime ATOD Use by Gender

Since 2006, the lifetime prevalence of drug use by Arkansas youth has declined. This decline generally mirrors the national findings.

## Current ATOD Use by Arkansas Students

Past 30-day use is recorded when youth report that they have used a substance at least once in the past 30 days. Past 30-day use is the best measure of the current use of alcohol, tobacco, and other drugs. Figure ES-4 shows that the most commonly used substances in the past 30 days were alcohol, alcopops (not shown since only three years' data), cigarettes, marïuana, and smokeless tobacco, in that order. Inhalants, sedatives, prescription drugs, and over-the-counter drugs were the other four substances that showed past 30day prevalence rates greater than two percent. Arkansas students had lower past 30-day prevalence rates than MTF students for alcohol, marijuana, cocaine, methamphetamines, stimulants and ecstasy across all grade levels with differences ranging from $0.1 \%$ to $4.6 \%$, depending on the substance and grade level. However, for tobacco products, 10th and 12th grade Arkansas students had somewhat higher prevalence rates for current tobacco use (both cigarettes and smokeless tobacco). Alcohol, marijuana and alcopops showed slight increases from $0.1 \%$ to $0.3 \%$. For all other substances, the past 30 -day substance use decreased or remained stable since the 2006 survey. While the declines are sometimes small, it is more important that the declines are consistent across time and occur across the full range of substances.

## Heavy ATOD Use Among Arkansas Students

The 2011 APNA survey measured heavy use for alcohol, cigarettes, and marijuana. Overall, binge drinking appears to be the largest heavy use problem among Arkansas youth. Table ES-2 shows that 10.0\% of youth (up slightly from $9.9 \%$ in the previous year) binge drank (defined as having five or more drinks on a single occasion) at least once in the past two weeks. Compared to 2006 findings, binge drinking among Arkansas youth has declined by $5.4 \%$. As is typical for most substances, binge drinking increases for Arkansas students as they progress through middle and high school.

Heavy cigarette use was defined as daily use of about a half-pack or more. Table ES-2 also shows that heavy cigarette use was relatively low, at $0.8 \%$ of all Arkansas students. Finally, heavy marijuana use was defined as the use of one or more marijuana cigarettes a day. A low percentage of Arkansas students (5.1\%) reported heavy use of marijuana. This is a slight increase from the previous year of $4.9 \%$.

The percentage of youth who used various ATOD substances, individually and in combination with other substances, is shown in Table ES-3. Overall, $13.1 \%$ of Arkansas youth reported using two or more substances within the past 30 days (vs. $13.2 \%$ in 2010 ) and $7.1 \%$ have used three or more

| Tobacco and Any 2 Other Drugs | 0.2 | 0.7 | 1.5 | 2.2 | 1.1 |

substances (same as in 2010). The most common combination is that of alcohol and tobacco (7.2\%) and alcohol and any other drug where $7.6 \%$ of Arkansas youth report using both in the past 30 days.

## Arkansas Students' Involvement in Antisocial Behavior

The APNA survey measures nine different antisocial behaviors or the behavioral markers for antisocial behaviors, such as arrest or school suspension. Figure ES-5 summarizes the past-year prevalence of these behaviors. The three highest prevalence rates were for school suspension (12.3\%), being drunk or high at school ( $9.1 \%$ ), and attacking someone with the intent to harm them (13.1\%). Of note, the largest decrease in antisocial behaviors since 2006 was seen in attacking someone with intent to harm, which decreased by $1.2 \%$ during the time period. Lower prevalence rates were also found for other antisocial behaviors other than drunk at school which increased by $0.2 \%$. For example, $4.3 \%$ of Arkansas students reported that they were arrested in the past year compared to $4.6 \%$ in 2010 . Fortunately, some behaviors were quite rare. For example, $0.7 \%$ of the youth surveyed reported taking a handgun to school in the past 12 months. Prevalence rates this low are considered below the level of reliable detection in a school survey such as the APNA. In general, fluctuations of the prevalence rates for antisocial behaviors across 2006-2011 are small, with the prevalence rates remarkably stable.

## The Risk and Protective Factor Profile of Arkansas Students

The APNA survey is based upon the risk and protective factor model of substance abuse prevention. Medical research has identified risk and protective factors for heart disease. Risk factors (such as high blood pressure) increase the likelihood of heart disease, and protective factors (such as exercise) decrease the likelihood of heart disease. In an analogous fashion,

Figure ES-5

social scientists have discovered a set of risk factors that increase rates of problem behaviors (including substance abuse, delinquency, violence, teen pregnancy, and school dropout) among adolescents.

A set of protective factors have also been identified which decrease the likelihood of youth involvement in the same problem behaviors. Risk and protective factors are organized into four domains: 1) the community, 2) the family, 3) the school, and 4) within the individual and with their peer interactions. Figures ES-6 and ES-7 show the prevalence of risk and protective factors for Arkansas students. Two features of these charts are key to understanding the information: 1) the cut points for the risk and protective factor scales; and $2)$ the dashed lines that indicate a "national" normative value. The cut point indicates the threshold level at which a population of students is considered to be elevated on the risk or protective factor. The dashed line on the chart is the national norm-i.e., the average value for students nationally-based on the 200,000 students whose results were used to create the risk and protective factor measurement system. When risk factors are above the norm ( $45 \%$ as indicated by the dashed lines on the figures), communities should be concerned; in contrast, levels of protective factors falling below the norm ( $56 \%$ as indicated by the dashed lines on figures) are also reason for concern.

In comparison to the national norm, risk factor scores for Arkansas youth in all four domains are generally lower, which is a good thing. Those risk factors that were elevated for Arkansas students were: Transitions and Mobility (54.0\%), and Interaction with Antisocial Peers (45.9\%). On many other risk factors, Arkansas students had significantly lower risk scores as shown on Figure ES-6.

In general, Arkansas students show a high number of protective factors, and they compare favorably to the national norm. Arkansas students are most elevated on Family Opportunities for Prosocial Involvement, School Opportunities for Prosocial Involvement, Religiosity, Social Skills, Belief in a Moral Order, Peer Rewards for Prosocial Involvement and Interaction with Prosocial Peers. Scores were lowest on Community Opportunities for Prosocial Involvement, Rewards for Prosocial Involvement and Prosocial Involvement in the Peer-Individual Domain, as shown in Figure ES-7.

Risk Factors - Percent of Students Above the Cutoff - 2011

Figure ES-7

## Section 1: Introduction

### 1.1 Overview of the 2011 APNA Report

This report is divided into four sections. The first section, Summary of the Survey Methods, describes how the survey was conducted, who participated, and procedures that were used to ensure that valid information was collected. It is written as a brief report accessible to all readers.

## The second section, Risk and Protective Factors for Substance

Abuse and Other Youth Problem Behaviors, begins with a discussion of the Risk and Protective Factor Model of substance abuse prevention, including the four domains of risk and protection (community, family, school, and peer/ individual). This is followed by a detailed analysis of the risk and protective factor results for each of the four domains. A final contribution to this section is an analysis of the role of aggregated risk and protective factors for Arkansas students. When the total number of risk and protective factors are added together for Arkansas students, this total is very predictive of both ATOD use and antisocial behavior.

The third section, Substance Use Outcomes, describes ATOD use and antisocial behavior among Arkansas youth. This section begins with a discussion of what substances were measured in the APNA, and the particular prevalence periods employed. Then, in sequence, this section discusses in detail the APNA findings related to lifetime use, use in the past 30 -days, and a series of special topics. The special topics include students' heavy use, the simultaneous use of multiple substances, students' attitudes and perceptions regarding substance use, sources and location of ATOD use, and several other topics. Whenever possible, these results are compared to the results of a national survey, Monitoring the Future (MTF).

The fourth section, Behavioral Outcomes Other Than Substance
Use, provides information on student behaviors and attitudes regarding a number of topics. First, the prevalence of a variety of antisocial behaviors in

Arkansas students is discussed. Other behaviors reported include the use of handguns and violence, disciplinary problems in school, assault, and arrest. These behaviors have been measured consistently by the APNA for the past several years, providing long-term trend data showing the progress of Arkansas students on these issues.

## How to Make the Best Use of This Report

This report is designed primarily as an electronic document and can be viewed with Adobe Reader. Viewing the report electronically will allow the reader to more effectively and efficiently digest the findings. Hyperlinks play a primary role in this process; they are clickable phrases or words that will take you to a new location of the report. You will know that you have encountered a hyperlink when the normal cursor image changes to the "hand" cursor. When this occurs, a mouse click will change your location in the report. This feature is useful when you want to compare findings from different sections of the report. For example, if you are interested in results involving just 6th graders, you can click on the list of tables and figures that specifically present 6 th grade data.

### 1.2 The APNA Survey Form

### 1.2.1 Development of the APNA Survey Form

The original survey questionnaire on which the APNA survey is based was developed by the Social Development Research Group at the University of Washington. The development process was funded by the Center for Substance Abuse Prevention (CSAP). The goal of the project was to develop a survey that provided scientifically sound information about: 1) the prevalence of youth ATOD use and antisocial behavior in the community; and 2) the prevalence of risk and protective factors in a community. The survey was further refined through a second project, the "Diffusion

Consortium Project," which involved seven states and was funded by four federal agencies: the National Institute of Drug Abuse (NIDA), Safe and Drug Free Schools Program, Office of Juvenile Justice and Delinquency Prevention, and CSAP. Normative data for the survey were developed in these two studies based on testing with more than 200,000 students in the United States.

Several steps were taken during the development of the survey instrument on which the APNA is based to maximize the validity of the collected survey data. These steps included: careful cognitive pretesting of the questionnaire to ensure that students understand the meaning of each question; creation of a well-developed and debugged administration protocol; and the development of uniform instructions read to all students who participate in the survey.

This basic questionnaire was modified in 2002 to create the APNA survey. Modifications, including the addition of specific questions about substance use, tobacco availability, and tobacco use, allowed the APNA survey to better meet the needs of Arkansas. In each year since, the questionnaire has been slightly modified to meet new requests for additional data. However, the measurement of risk and protective factors, along with the prevalence of ATOD use and antisocial behaviors, has always been maintained. See Appendix A for a copy of the 2011 APNA survey questionnaire.

### 1.2.2 Content and Focus of the APNA Survey Form

Prevalence of ATOD Use and Antisocial Behavior. The APNA survey measures the current prevalence of a broad range of ATOD substances. The substances include: 1) alcohol, 2) cigarettes, 3 ) smokeless tobacco, 4) marijuana, 5) hallucinogens, 6) cocaine, 7) inhalants, 8) stimulants, 9) sedatives, 10) methamphetamines, 11) ecstasy, 12) heroin, 13) prescription drugs, 14) over-the-counter drugs, and 15) alcopops. The questions that ask about substance use are similar to those used in the Monitoring the Future Survey. Using comparable ATOD questions means that comparisons between the two surveys can be made.

Risk and Protective Factors. Arkansas uses the Risk and Protective Framework to guide prevention efforts aimed at reducing youth problem behaviors. This framework, developed by J. David Hawkins, PhD, Richard F. Catalano, PhD, and their colleagues at the University of Washington, Social Development Research Group, explains the relationship between risk and protective factors and youth problem behaviors. Risk factors are characteristics of school, community, and family environments, as well as characteristics of students and their peer groups. Risk factors predict increased likelihood of drug use, delinquency, school dropout, teen pregnancy, and violent behavior among youth. For example, Hawkins and Catalano have found that children who live in families with high levels of conflict are more likely to become involved in problem behaviors such as delinquency and drug use than children who live in families with low levels of family conflict.

Protective factors exert a positive influence or buffer against the negative influence of risk, thus reducing the likelihood that adolescents will engage in problem behaviors. Protective factors identified through research reviewed by Hawkins and Catalano include: bonding to family, school, community and peers; healthy beliefs and clear standards for behavior; and individual characteristics. For bonding to serve as a protective influence, it must occur through involvement with peers and adults who communicate healthy values and set clear standards for behavior.

Research on risk and protective factors has important implications for prevention efforts. The premise of the risk and protective factor model is that in order to promote positive youth development and prevent problem behaviors, it is necessary to address those factors that predict the problem behaviors. By measuring risk and protective factors in a population, prevention programs can be implemented that will reduce the elevated risk factors and increase the protective factors. For example, if academic failure is identified as an elevated risk factor in a community, then mentoring, tutoring, and increased opportunities and rewards for classroom participation can be provided to improve academic performance.

A total of 19 risk factors and 13 protective factors are measured in the 2011 APNA survey. Some of the risk factors require more than one scale for adequate measurement. As a result, there are 26 separate risk factor scales and 13 protective factor scales measured by the survey. To find a complete list of the risk and protective factors and the corresponding risk and protective factor scales within the Risk and Protective Factor Model, please go to http://www. arkansas.gov/dhs/dmhs/adap_survey.htm.

Before the percentage of youth at-risk on a given scale could be calculated, a scale value or "cut point" is used that best separates the at-risk group from the group that is not at-risk. Cut points are specific risk or protective factor
threshold values that are used to classify a youth as being elevated on risk factors scales, or having insufficient levels of protection as measured by protective factor scales. The cut-point score best classifies youth into groups of those who are more at-risk or less at-risk for ATOD use and other problem behaviors. The cut points have remained stable in youth populations and will be used to produce the profiles for future surveys.

In the 2011 APNA survey, students responded to a total of 224 items. The questions were printed in a test booklet that was scored by a machine. See Appendix A for a complete copy of the questionnaire. To find a complete item dictionary that lists the risk and protective factor scales and the items they contain, as well as the outcome variables and a document with tabulations for the number and percentages of collected responses for each item in the 2011 APNA survey, please go to http://www.arkansas.gov/dhs.dmhs/ adap_survey. htm.

A Note Regarding APNA 2006 Data. As reported in the 2007 APNA report, some methodological problems were encountered in the 2006 survey year. These problems resulted in some uncertainties for a small number of the risk and protective factor prevalence estimates. In this report, when examining multi-year trend data, the most accurate 2006 prevalence estimates are included. This approach allows for the most accurate interpretation of state-level long-term trend data. As a consequence, the 2011 reports for specific geographic areas of the state (i.e., regional or school district reports) will have a small number of minor variations from this report in regard to their reported 2006 state-level prevalence estimates for risk and protective factors.

### 1.3 Administration Procedures

### 1.3.1 Description of APNA Administration Procedures

In August 2011, a recruiting packet was developed and emailed to each regional Prevention Resource Coordinator (PRC) by the Project Director. The recruiting packet included a school agreement form, survey fact sheet, a copy of the survey instrument, administration instructions for the school contact coordinator, teacher administration instructions, and a copy of the parent notification letter.

PRC personnel were encouraged to personally visit each of their school sites to obtain school participation. A phone call to the previous year's participants was also initiated as needed. PRC personnel followed up by phone, fax and email to obtain the school participation agreement form from superintendents. A concerted effort was made to contact every public school district in the state to participate in the survey.

Surveys were mailed to participating schools during September and October 2011. Administration of the surveys took place during November 2011. The school contacts were given specific instructions on how to maintain student confidentiality and how to collect and return the completed surveys. Teachers in surveyed classrooms were given a script to read. Completed surveys were to be returned to the sub-contractor, International Survey Associates, by December 1, 2011. International Survey Associates staff followed up with phone calls directly to school contacts who had not returned surveys by December 15, 2011 to ensure that all completed and unused surveys were returned.

## Description of Procedures to Protect Student and Parent Rights

A special emphasis was placed on appropriately notifying parents regarding the risks and benefits of their child's participation in the survey, and how the passive consent process works. As appropriate, state- and local-level employees participating in the APNA administration process were instructed on the procedures to protect student and parent rights. This included all state-level and PRC employees involved with the APNA. In addition, school contacts were given detailed instructions on how to maintain student confidentiality, including how to package and seal the envelopes containing the surveys, and how to promptly initiate their return to International Survey Associates.

Finally, teachers were provided a script, which used developmentally appropriate language and described student rights to participate or not participate in the survey as a whole or to provide information on any specific question. Teachers read the script in each classroom participating in the survey. The confidentiality of the survey was stressed to Arkansas students through the instructions and administration procedures. Students were assured multiple times that the survey was voluntary, anonymous, and confidential. They were told that no one would see their answers and that a survey could not be traced back to an individual student.

### 1.3.2 Description of Survey Scanning and Scoring Procedures

Once returned to International Survey Associates, the survey forms were checked to eliminate blank or otherwise unusable forms and were automatically scanned and scored by International Survey Associates' computers. As part of the database development process, International Survey Associates' scoring system automatically suppresses the calculation of results when the specific subgroup that is being analyzed (e.g., a school, or school grade level) contains less than 20 students. This is done to provide an additional layer of confidentiality protection to participating students. While the student's data are not included in any report including groups smaller than 20 students, their data still contribute to the reports for larger geographic areas, such as the regional- and state-level reports.

### 1.4 Creation of the 2011 APNA Survey Database

### 1.4.1 Survey Distribution and Processing

Districts participating in the APNA Survey were contacted and shipped the necessary number of surveys along with a small number of extra surveys; having an excess of surveys at the school site allows for a more efficient and speedier survey administration, minimizing the burden of APNA participation at the school level.

Surveys returned to International Survey Associates were visually scanned to ensure that they were not blank, defaced, or otherwise unreadable. These surveys were excluded from the database. Of the remaining surveys, a total of 97,705 were scanned into the database. Surveys that failed to pass

Table 1-1 Number of Students Surveyed

| Total Students Surveyed | 100,371 |
| :--- | ---: |
| Total Students Surveyed <br> Providing Invalid Surveys | 9,903 |
| Number Valid Surveys <br> in Grade 6 | 25,980 |
| Number Valid Surveys <br> in Grade 8 | 25,464 |
| Number Valid Surveys <br> in Grade 10 | 21,957 |
| Number Valid Surveys <br> in Grade 12 | 17,067 |
| Total Number of Valid Surveys | 90,468 | the validity checks, as well as surveys from students from grades 7, 9 and 11 were also excluded from the survey database. As seen in Table 1-1, a total of 9,903 surveys were removed for these and other validity reasons prior to further analysis.

### 1.4.2 Assessment of the Validity of the Individual Survey Protocols

Because the survey was anonymous, most of the reasons for students to exaggerate or deny behaviors were eliminated. However, several checks were built into the data screening process to minimize the inclusion of students who were not truthful in their responses. All surveys that were deemed to be not truthful were eliminated from the final analysis. Invalid individual student surveys were identified using five specific criteria: 1) the student indicated that he or she was "Not Honest At All" in completing the survey; 2) the student indicated that he or she had used the non-existent drug phenoxydine; 3) the student reported an impossibly high frequency of multiple drug use; 4) there was a large age differential between grade level and the student's age as reported by the students; and 5) the student report contained logical inconsistencies between past 30 -day use and lifetime use rates. In addition to reasons cited in 1.4.1 and as shown in Table 1-1, a total of 9,903 surveys were removed from the final data set and later analyses as a result of one or more of these reasons.

After all checks were completed, a total of 90,468 students contributed their data to the final database for analysis.

### 1.4.3 Survey Participants by County and Region

The State of Arkansas has 75 counties, divided into 13 ATOD service regions. Several tables have been prepared that supply regional- and countylevel results for the 14 categories of substances. Results for the substance use rates for the past 30 days and lifetime for each of the 13 participating regions and 74 participating counties in Arkansas can be found at: http://www. arkansas.gov/dhs/dmhs/adap_survey.htm.

Because ATOD use, antisocial behavior, and the prevalence of risk and protective factors normally vary by grade level, large differences in grade level participation by region would be cause for concern and would complicate comparisons between regions. Fortunately, the grade level variation in participation between regions was small. (Table 1-2)

### 1.5 Student Demographics

The characteristics of the youth who participated in the 2011 APNA survey are presented in Table 1-3 and Figures 1-1,1-2, and 1-3. There are only slight demographic changes from the 2010 survey. The 2011 student demographics are also shown separately for grades $6,8,10$, and 12. A nearly equal number of males and females took the survey in all grades
(female $-51.5 \%$ and males - 48.5\%). The majority of respondents were White (58.3\%), $16.9 \%$ were African American, $9.7 \%$ were Hispanic, and the balance were distributed among other ethnic groups.

An analysis of the family structure of respondents showed that $49.1 \%$ lived with both of their biological parents, $19.3 \%$ lived in a step-family structure, and $26.4 \%$ lived with a single parent.

Table 1-2

## Section 2: Risk and Protective Factors

### 2.1 The Risk and Protective Factor Model

The Arkansas Prevention Needs Assessment (APNA) Survey is based upon the risk and protective factor model of substance abuse prevention. In medical research, both risk and protective factors have been found for heart disease and other health problems. For example, risk factors for heart disease include such characteristics or events as excessive consumption of high-fat foods, smoking, chronic stress, and being overweight. Protective factors, characteristics of the person or environment, decrease the likelihood of a negative event occurring. For example, adequate exercise and proper nutrition reduce the risk of heart disease. Just as medical research discovered the risk and protective factors for heart disease, social scientists have discovered a set of risk and protective factors that place young people at risk for the problem behaviors of substance abuse, delinquency, violence, teen pregnancy, and school dropout.
J. David Hawkins, PhD, Richard F. Catalano, PhD, and their colleagues at the University of Washington have reviewed more than 30 years of existing work on risk factors from various fields and have completed extensive work of their own to identify risk factors for youth problem behaviors. They identified risk and protective factors in four domains: 1) the community, 2) the family, 3) the school, and 4) within individuals and with peer interactions. Many
of the problem behaviors faced by youth - delinquency, substance abuse, violence, school dropout, and teen pregnancy - share many common risk and protective factors. Programs designed to reduce those common risk factors, or increase protective factors, will have the benefit of reducing several problem behaviors.

Using the risk and protective factor model, Hawkins, Catalano and their colleagues developed an approach that communities can use to reduce youth problem behaviors. An overview of the risk factors and protective factors that have been shown to be related to youth problem behaviors and their link to the APNA survey can be found at http://www.arkansas.gov/dhs/dmhs/ adap_survey.html.

This section of the report is organized according to these four domains: community, family, school, and peer/individual. For each domain, the definition of each risk or protective factor is presented, followed by risk and protective factor results for Arkansas students by grade. Risk and protective factor charts are also provided to illustrate Arkansas risk and protection in relation to students from a seven state sample in the United States.

## How to Read the Risk and Protective Factor Charts in this Section

Two components of the risk and protective factor charts are key to understanding the information that the charts contain: 1) the cut points for the risk and protective factor scales; and 2) the dashed lines that indicate a "national" value.

## Cut Points

For risk factors, having an elevated risk factor increases the adolescent's probability of engaging in a problem behavior. Conversely, for a protective factor, having an elevated protective factor reduces the adolescent's probability of engaging in a problem behavior. Before the percentage of youth who are elevated on either risk or protective factors can be calculated, a scale value (traditionally called a cut point) was needed to define the point at which the risk or protective factor could meaningfully affect the probability of the negative behavior occurring. The APNA survey instrument was designed to assess adolescent substance use, antisocial behavior and the risk and protective factors that predict these adolescent problem behaviors. During the instrument development process, risk and protective factor-based surveys were given to more than 200,000 youth nationwide. Because of this, it was possible to identify two groups of youth, one that was more at risk for problem behaviors and another group that was less at risk, on the basis of their risk and protective factor scores. For each risk and protective factor, a cut-point value was then
determined that best discriminated between youth involved in problem behaviors and those who were not. Various outcomes were used for determining the cut-point values, including ATOD use, a variety of antisocial behaviors, and the students' self-report of academic grades (the more at-risk group received "D" and "F" grades, the less at-risk group received "A" and "B" grades).

The cut points that were determined have remained stable over more than a decade and are used to produce the profiles for future surveys. Since the cut points are stable, the percentage of youth above the cut point on a scale (at-risk) can be consistently measured and used to evaluate the progress of prevention programs over time. For example, if the percentage of youth at-risk for family conflict prior to implementing a community-wide family/ parenting program was $60 \%$ and then decreased to $50 \%$ one year after the program was implemented, the program would be viewed as helping to reduce family conflict.

## Dashed Line

Levels of risk and protection in your community also can be compared to a national sample. The dashed line on each risk and protective factor chart represents the percentage of youth at-risk or with protection for the seven-state sample of 200,000 students upon which the cut points were established. The seven states included in the norm group were: Colorado, Illinois, Kansas, Maine, Oregon, Utah, and Washington. All the states have a mix of urban and rural students.

### 2.1.1 Community Domain Risk and Protective Factors

Table 2-1

| Youth at Risk | Problem Behaviors |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | O <br> O <br> ¢ <br> 0 <br> 0 |
| Community |  |  |  |  |  |
| Availability of drugs | $\checkmark$ |  |  |  | $\checkmark$ |
| Availability of firearms |  | $\checkmark$ |  |  | $\checkmark$ |
| Community laws and norms favorable toward drug use, firearms and crime | $\checkmark$ | $\checkmark$ |  |  | $\checkmark$ |
| Media portrayals of violence |  |  |  |  | $\checkmark$ |
| Transitions and mobility | $\checkmark$ | $\checkmark$ |  | $\checkmark$ |  |
| Low neighborhood attachment and community disorganization | $\checkmark$ | $\checkmark$ |  |  | $\checkmark$ |
| Extreme economic and social deprivation | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Community domain risk and protective factors focus on the public environment in which the adolescent is living. When looking at the community domain, it is important to consider other factors beyond simply how members of a community interact with the youth of the community. Youth benefit from living in an area where neighbors and community members show concern for
them, offer them support, and give encouragement and praise. Youth benefit from living in a community that functions in a socially healthy manner. What is the community like? Are drugs and guns readily available? Is there an active presence of law enforcement officers in the community? Is the community lacking in economic resources? Do community members, businesses, or police turn a blind eye toward drug use and antisocial behaviors, or condone such behaviors? Is there a sense of community disorganization or do members of the community work together toward common goals?

All of these community issues, and more, play significant roles in shaping the behaviors of the youth who live within a particular community. By understanding how youth perceive their neighborhood, Arkansas communities can get a better sense of how they need to change in order to reduce the risk that youth will participate in problem behaviors.

Definitions of all community domain risk factors, as well as scale scores for the community domain are provided on the next pages. Table 2-1 shows the links between the community risk factors and the five problem behaviors. The check marks indicate where at least two well-designed, published research studies have shown a link between the risk factor and the problem behavior.

## Community Domain Risk Factors

Availability of Drugs. As drugs become more available in a community, there is a higher risk that young people will abuse drugs in that community. Perceived availability of drugs is also associated with increased risk of ATOD use. For example, in schools where youth just think drugs are more available, a higher rate of drug use occurs.

Availability of Firearms. Firearm availability is directly linked to the probability of serious assault, suicide, and homicide. If a gun is present in the
home, it is much more likely to be used against a relative or friend than an intruder or stranger. Also, when a firearm is used in a crime or assault instead of another weapon or no weapon, the outcome is much more likely to be fatal. Most studies show a positive relationship between the presence of firearms and the probability of violent crime. Given the lethality of firearms, and the increased likelihood of conflict escalating into homicide when guns are present, firearm availability is included as a risk factor.

Community Laws and Norms Favorable to Drug Use, Firearms, and Crime. Community norms-the attitudes and policies a community holds about drug use and crime-are communicated in a variety of ways: through laws and written policies, through informal social practices, and through the expectations parents and other community members have of young people. When laws and community standards are favorable toward drug use or crime, or even if they are just unclear, youth are at higher risk.

Transitions and Mobility. Even normal school transitions predict increases in problem behaviors. When children move from elementary school to middle school, or from middle school to high school, increases in the rates of drug use, school misbehavior, and delinquency are measurable.

Communities with high rates of mobility appear to be linked to an increased risk of drug use and crime problems. The more often people in a community move, the greater the risk of both criminal behavior and drug-related problems in families. While some people find buffers against the negative effects of mobility by quickly making connections in new communities, others are less likely to have the resources to deal with the effects of frequent moves and are more likely to have problems.

## Low Neighborhood Attachment and Community

Disorganization. Higher rates of drug problems, juvenile delinquency and violence occur in communities or neighborhoods where people have little
attachment to the community, where the rates of vandalism are high, and where there is low surveillance of public places. These conditions are not limited to low-income neighborhoods; they can also be found in wealthier neighborhoods. The less homogeneous a community (in terms of race, class, religion, and even the mix of industrial to residential neighborhoods), and the less connected its residents may feel to the overall community, the more difficult it is to establish clear community goals and identity. The challenge of creating neighborhood attachment and organization is greater in these neighborhoods.

Perhaps the most significant issue affecting community attachment is whether residents feel they can make a difference in their lives. If the key players in the neighborhood - merchants, teachers, police, and human services personnel - live outside the neighborhood, residents' sense of commitment will be less. Lower rates of voter participation and parental involvement in schools also indicate lower attachment to the community.

Extreme Economic Deprivation. Children who live in neighborhoods characterized by extreme poverty are more likely to develop problems with delinquency, violence, teen pregnancy, and school dropout. Children who live in these areas are also more likely to have problems with drugs later on. Please note that a scale has not been developed for this risk factor, and the APNA survey does not gather results for this risk factor.

Media Portrayals of Violence. The role of media violence on the behavior of viewers, especially young viewers, has been debated for more than three decades. Research over that time period has shown a clear correlation between media portrayal of violence and the development of aggressive and violent behavior. Exposure to violence in the media appears to have an impact on children in several ways: 1) children learn violent behavior from watching actors model that behavior; 2) they learn violent problem-solving strategies; and 3) media portrayals of violence appear to alter children's
attitudes and sensitivity to violence. Please note that a scale has not been developed for this risk factor, and the APNA survey does not gather results for this risk factor.

## Community Domain Protective Factors

## Community Opportunities for Prosocial Involvement and

 Community Rewards for Prosocial Involvement. CommunityOpportunities for Prosocial Involvement measures student perceptions on the ways that they can become positively involved in their community. For
example, youth sports teams, 4-H clubs, police Explorer organizations, and community service clubs are all examples of avenues through which youth could engage in prosocial community activity. Community Rewards for Prosocial Involvement measures the likelihood that youth feel that community members (e.g., neighbors, family friends) recognize, support, and encourage youth to be positively involved in the community. Both of these protective factors generally increase the likelihood that youth will not engage in antisocial behavior.

Table 2-2

Risk Factors: Community Domain (2011)

Figure 2-2

### 2.1.2 Family Domain Risk and Protective Factors

Table 2-3

| Youth at Risk | Problem Behaviors |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | 0 <br> 0 <br> 0 <br> 0 <br> 0 |
| Family |  |  |  |  |  |
| Family History of the Problem Behavior | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Family Management Problems | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Family Conflict | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Favorable Parental Attitudes and Involvements In the Problem Behavior | $\checkmark$ | $\checkmark$ |  |  | $\checkmark$ |

For the family domain, one must consider more than parents' personal interaction with their children. Youth benefit from being bonded with their family and from belonging to a family in which their parents offer support, encouragement, and praise. Other important factors that can contribute to youth problem behaviors are whether or not the youth's parents or siblings have used substances, approve of the use of substances, or have participated in antisocial behaviors. If a youth's living situation is full of conflict (fights and arguments) and disorganization (lack of family communication or parents' not knowing the whereabouts or doings of their children), the youth is also at-risk for problem behaviors.

Definitions of all family domain risk factors, as well as scores for the family domain are provided on the following pages. Table $2-3$ shows the links be-tween the family risk factors and the five problem behaviors. The check marks indicate where at least two well-designed, peer-reviewed research studies have shown an association between the risk factor and the problem behavior.

## Family Domain Risk Factors

Family History of Antisocial Behavior. If children are raised in a family with a history of addiction to alcohol or other drugs, the risk of the child having alcohol and other drug problems increases. If children are born or raised in a family with a history of criminal activity, their risk of juvenile delinquency increases. Similarly, children who are raised by a teenage mother are more likely to become teen parents, and children of dropouts are more likely to drop out of school themselves.

Poor Family Management. Poor family management practices include lack of clear expectations for behavior, failure of parents to monitor their children (knowing where they are and who they are with), and excessively severe or inconsistent punishment.

Family Conflict. Persistent, serious conflict between primary caregivers or between caregivers and children appears to enhance risk for children raised in these families. Conflict between family members appears to be more important than family structure. Whether the family is headed by two biological parents, a single parent, or some other primary caregiver, children raised in families high in conflict appear to be at risk for all of the problem behaviors.

## Parental Attitudes Favorable to ATOD Use and Parental

Attitudes Favorable to Antisocial Behavior. Parental attitudes and behavior toward drugs, crime, and violence influence the attitudes and behavior of their children. Parental approval of young people's moderate drinking, even under parental supervision, increases the risk of the young person using marijuana. Similarly, children of parents who excuse their children for breaking the law are more likely to develop problems with juvenile delinquency. In families where parents display violent behavior toward those outside or inside the family, there is an increased risk of that child becoming violent. Further, in families where parents involve children in their own drug or alcohol behavior, for example, asking the child to light the parent's cigarette or to get the parent a beer, there is an increased likelihood that their children will become drug abusers in adolescence.

## Family Domain Protective Factors

Family Attachment. When children feel a strong, emotional attachment to their family, this serves as a powerful positive influence in their lives. Strong, positive family attachment can ameliorate the negative influences of numerous risk factors, including community and peer influences that otherwise would lead a child to involvement in problem behaviors.

## Family Opportunities for Prosocial Involvement and Family

Rewards for Prosocial Involvement. Family opportunities for prosocial involvement refer to the opportunities for positive, rewarding interactions between children and their families. The specifics of the opportunities can

Figure 2-4

Protective Factors: Family Domain (2011)

vary enormously, making measurement of this protective factor difficult, but examples include family outings that the children find rewarding, positive family rituals around holidays, and positive behavioral interaction between the adult caregivers and the children. Rewards for prosocial involvement are different, in that it is the contingencies the child experiences in the family for acting in a prosocial manner. For example, rewarding the child for behavior such as helping siblings with a task, completing assigned chores on time, or following family rules will reinforce that behavior, which in turn leads to numerous positive benefits.

### 2.1.3 School Domain Risk and Protective Factors

Table 2-5

| Youth at Risk | Problem Behaviors |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | 0 <br> 0 <br> 0 <br> 0 <br> 0 |
| School |  |  |  |  |  |
| Poor Academic Achievement | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Low School Commitment | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

In the school domain, the early years are important for creating or decreasing the level of risk for children. Academic failure in elementary school puts children at risk for substance use, delinquency, teen pregnancy, school drop out, and violence later in life. It appears that the experience of failure, not necessarily the student's ability, increases the risk of problem behaviors. Further, a
child with early and persistent antisocial behavior is at risk for substance use and other problems later in life.

These two risk factors (academic failure and early engagement in antisocial behavior) indicate that prevention programs should begin early in a student's schooling. Programs that can effectively target the needs of the school population will help to decrease the level of risk, thereby decreasing problem behaviors later in school. The Arkansas data will help schools target the problem behaviors and student populations that are at the greatest need for services.

As with the community and family domains, school domain protective factors buffer against the effects of risk factors and increase protection. When youth have healthy relationships with their teachers, when they feel as if they are able to play an active role in their classes and in their school, and when they receive encouragement and support, they are more bonded to their school and their commitment to school is less likely to falter.

Table 2-5 shows the links between the school risk factors and the five problem behaviors. The check marks indicate where at least two well-designed, peer-reviewed research studies have shown an association between the risk factor and the problem behavior.

## School Domain Risk Factors

Low School Commitment. Lack of commitment to school means the young person has ceased to see the role of student as a viable one. Young people who have lost this commitment to school are at higher risk for all five problem behaviors.

Poor Academic Achievement. The measurement of poor academic achievement is based on students' self-reports of their school grades. Poor
achievement in school operates in numerous ways to limit students' future opportunities.

## School Domain Protective Factors

School Opportunities for Prosocial Involvement and School
Rewards for Prosocial Involvement. Comparable to family opportunities and rewards, school opportunities for prosocial involvement refers to the students' perception that there are numerous rewarding prosocial activities that they can participate in within the school environment. The ability of
the student to engage in prosocial opportunities at school is important to keeping the student engaged and involved with school. That, of course, leads to a cascade of other positive consequences in the student's life. Rewards for prosocial involvement are also analogous to family rewards for prosocial involvement. In this domain, the issue is whether the school environment actively reinforces the student's prosocial behavior (appropriate conduct, dress, interaction with others). School environments that positively reinforce appropriate behavior can significantly increase the success of their school as well as help the individual student succeed.

Table 2-6

| Early and Persistent Antisocial Behavior | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Rebelliousness | $\checkmark$ | $\checkmark$ |  | $\checkmark$ |  |
| Friends Who Engage In a Problem Behavior | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Gang Involvement | $\checkmark$ | $\checkmark$ |  |  | $\checkmark$ |
| Favorable Attitudes Toward the Problem Behavior | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |
| Early Initiation of the Problem Behavior | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Depressive Symptoms | $\checkmark$ | $\checkmark$ |  |  |  |
| Intention to Use ATODs | $\checkmark$ |  |  |  |  |
| Constitutional (Biological) Factors | $\checkmark$ | $\checkmark$ |  |  | $\checkmark$ |

The fourth domain, peer-individual, addresses peer influence as well as factors that spring from the individual. Youth are at-risk for problem behaviors when they have friends who engage in unfavorable behaviors or when they have friends who have favorable attitudes toward these behaviors (i.e., it is seen as "cool"). In addition, youth are at-risk for problem behaviors when they are depressed, rebellious, or feel alienation. Other constitutional (that is, biological) factors also play a part in whether or not a student is at risk for ATOD use or antisocial behaviors.

Definitions of all peer/individual domain risk and protective factors, as well as a description of individual characteristics, bonding, and healthy beliefs and clear standards, are presented in this section. Table 2-7 shows the links between the peer/individual risk factors and the five problem behaviors. The check marks indicate where at least two well-designed, peer-reviewed research studies have shown an association between the risk factor and the problem behavior.

## Peer-Individual Domain Risk Factors

Rebelliousness. Young people who feel they are not part of society, are not bound by rules, don't believe in trying to be successful or responsible, or who take an active rebellious stance toward society, are at higher risk of drug abuse, delinquency, and school dropout.

Early Initiation of Drug Use. The earlier young people begin using drugs, committing crimes, engaging in violent activity, becoming sexually active, and dropping out of school, the greater the likelihood that they will have problems with these behaviors later on. For example, research shows that young people who initiate drug use before 15 years of age are at twice the risk of having drug problems as those whose initial use is after 19 years of age.

Early Initiation of Antisocial Behavior. Boys who are aggressive in grades K-3 are at higher risk for substance abuse and delinquency. When a boy's aggressive behavior in the early grades is combined with isolation or withdrawal, there is an even greater risk of problems in adolescence. This increased risk also applies to aggressive behavior combined with hyperactivity or attention deficit disorder.

This risk factor also includes persistent antisocial behavior in early adolescence, like misbehaving in school, skipping school, and getting into fights with other children. Young people, both girls and boys, who engage in these behaviors during early adolescence are at increased risk for drug abuse, delinquency, teen pregnancy, school dropout, and violence.

Favorable Attitudes Toward Antisocial Behavior. Favorable attitudes toward antisocial behavior can take the form of approval of the behavior, a desire to participate, or approval of others who engage in the behavior. Any of these specific attitudes are known to directly lead to greater involvement in antisocial behavior.

Favorable Attitudes Toward Drug Use. Favorable attitudes toward drug use can take the form of approval of the use of substances in general, or in the use of a specific substance, a desire to participate in drug use, or approval of others who engage in the behavior. Any of these specific attitudes are known to directly lead to greater involvement in drug use.

Intentions to Use. Many prevention programs focus on reducing the intention of participants to use ATODs later in life. Reduction of intention to use ATODs often follows successful prevention interventions.

Perceived Risks of Drug Use. When students perceive that drug use carries significant personal risk, they are less likely to engage in use. Perceived risk has been recognized for decades as a significant predictor of drug use, and student beliefs about drug-related risk have been wellmeasured since the 1970 s. The perceived risks are influenced by a number of cultural- and peer-related factors, which can either increase or decrease the perceived risk.

Interaction with Antisocial Peers. Research has demonstrated that youth who associate with peers who engage in problem behaviors are much
more likely to engage in the same problem behaviors. Even when young people come from well-managed families and do not experience other risk factors, just hanging out with those who engage in problem behaviors greatly increases their risks. However, young people who experience a low number of risk factors are less likely to associate with those who are involved in problem behaviors.

Friends' Use of Drugs. Modeling of peer behavior is part of the adolescent experience. When a significant proportion of the student's friends are using drugs, especially without any apparent negative consequences, this leads to an increased likelihood of drug involvement.

Sensation Seeking. Constitutional factors have a biological or physiological basis. These factors are often seen in young people with behaviors such as sensation-seeking, low harm-avoidance, and lack of impulse control. These factors appear to increase the risk of young people abusing drugs, engaging in delinquent behavior, and/or committing violent acts.

Rewards for Antisocial Involvement. Adolescents will have opportunities to become involved with various student subgroups, some of whom will support and promote antisocial behavior. If the student is involved with peers who positively reinforce the student for their antisocial behavior, this increases the likelihood of further involvement in problem behavior.

Gang Involvement. Youth who belong to gangs are more at-risk for antisocial behavior and drug use. Gang membership has been linked to violence, shootings, destruction of public property, and involvement in other illegal behaviors including distribution of drugs.

Depressive Symptoms. Young people who are depressed are more frequently involved in the criminal justice system and are more likely to use drugs. When depressed, youth have difficulty in identifying and engaging in
pro-social activities. They consequently do not gain recognition for demonstrating positive behaviors or do not develop attachments to their schools or communities. In the 2011 APNA survey, youth who scored highest on the items measuring depressive symptoms also scored significantly higher on all of the drug use questions.

## Peer-Individual Domain Protective Factors

Religiosity. Involvement with a faith community protects the adolescent from involvement in problem behaviors.

Social Skills. Social skills-the ability to successfully and positively interact with others-are known to facilitate life success in a number of ways. Students are frequently faced with social situations in which they can either become involved with or avoid problem behaviors. Having good social skills, which allows youth to navigate these situations without negative social consequences, is known to predict healthy development.

Belief in the Moral Order. This protective factor measures the student's commitment to a common body of ethical and moral precepts generally accepted by all members of a society. For example, questions ask about the student's commitment to not stealing, cheating, and to being honest with others. Commitment to a shared ethical system binds the youth to the culture, promotes prosocial involvement, and reduces the likelihood that the student will become involved in antisocial behavior.

Prosocial Involvement. There are a number of ways that adolescents can be involved with their peers in prosocial activities. The list of potential activities is virtually limitless (which makes this protective factor difficult to measure), but not all adolescents avail themselves of the opportunities. When they do, involvement in prosocial activities is known to increase the likelihood that they will remain drug-free.

Rewards for Prosocial Involvement. Peer relationships can reward the adolescent for prosocial involvement. Those that do are known to increase the extent of the adolescent's prosocial involvement, and consequently have a beneficial effect in helping the adolescent avoid problem behaviors.

Involvement with Prosocial Peers. As might be expected, when adolescents are involved with prosocial peers, numerous positive effects are seen. They are more likely to engage in prosocial activities, be rewarded for those activities, and have a greater personal commitment to not engaging in problem behaviors.

Protective Factors: Peer/Individual Domain (2011)

### 2.2 Risk and Protective Factor Results for Arkansas Students

### 2.2.1 Overview of Findings from the 2011 APNA

## Risk Factors

In comparison to the national norm, risk factor scores for Arkansas youth in all four domains are generally lower, which is a good thing. Those risk factors that were elevated for Arkansas students were: Transitions and Mobility (54.0\%), Interaction with Antisocial Peers (45.9\%). On many other risk factors, Arkansas students had notably lower risk scores. These included: Perceived Availability of Drugs (27.7\%), Parental Attitudes Favorable to Drug Use (27.2\%), Friends' Use of Drugs (26.3\%), Early Initiation of Drug Use (24.8\%), Peer Favorable Attitudes to Drug Use (24.2\%) and Gang Involvement (22.0\%).

In general, the grade level changes were as expected. For many risk factor scales the levels of risk most often increase with increasing age and peak in the 10th or 12th grades. For example, in the Rewards for Antisocial Behavior risk scale, $23.9 \%$ of 6 th graders, $37.2 \%$ of 8 th graders, $42.8 \%$ of 10 th graders, and $56.6 \%$ of 12 graders were at risk. The jump in risk from grade 6 to grade 8 is similar to the jump in drug and alcohol use that usually occurs during that time frame. Another example is Parental Attitudes Favorable to Antisocial Behavior. In the 6th grade only 31.4\% of students are elevated on this risk factor, but this increases to nearly $50 \%$ in both the 10 th and 12 th grades.

However, for many other risk factors, there is only limited progression with age, if any. Laws and norms favorable to drug use actually decline from 6th to 12th grade in Arkansas students. So it is not inevitable that students will increase in their number of elevated risk factors as they progress through adolescence.

For Arkansas students, two unusual grade-related findings can be noted. For Transitions and Mobility, 10th grade students were higher than the other grade levels, at $59.6 \%$. Also, for Family Conflict, 8th grade students were notably higher than the other grades at $46.2 \%$.

## Protective Factors

In general, Arkansas students show a high number of protective factors, and they compare favorably to the national norm. Arkansas students are most elevated on Religiosity (68.1\%), Social Skills (67.9\%), Peer Rewards for Procosial Involvement (64.6\%), Belief in a Moral Order (62.7\%), Interaction with Prosocial Peers (61.5\%), School Opportunities for Positive Involvement (60.4\%), and Family Opportunities for Social Involvement (59.9\%). They were lowest on Community Rewards for Prosocial Involvement (46.7\%) and Peer Prosocial Involvement (44.5\%).

## Section 3: Substance Use Outcomes

This section reports the use of alcohol, tobacco, and other drugs by Arkansas youth. A number of important topics are investigated by the APNA, including experimentation, current use, heavy use, and a variety of contextual factors such as the location of use and student and parent attitudes toward ATOD use.

### 3.1 Introduction to the Measurement of Substance Use Outcomes

### 3.1.1 Substances and Prevalence Periods That Are Measured in the APNA Survey

The APNA measures the prevalence of 15 substances in Arkansas youth. The specific substances, and their measured prevalence periods, are shown in Table 3-1. With the exception of alcopops, which was first reported in 2009, all other substances have been routinely measured by the APNA since its inception, providing long-term trend data for policy and planning purposes. These substances are also routinely measured in national surveys, including the Monitoring the Future Survey (MTF), which has been conducted since 1976 and is used to provide a national comparison for the APNA's findings.

Lifetime use is recorded when a student reports that they have used a substance at least once in their lifetime. Lifetime use is typically viewed as the best measure of youth experimentation with alcohol, tobacco, and other drugs. Past 30-day use is recorded when youth report that they have used a substance at least once in the past 30 days. Past 30-day use is typically viewed as the best measure of the ongoing use of alcohol, tobacco, and other drugs. For alcohol use only, binge drinking is measured using a two-week prevalence period.

### 3.1.2 Comparison Groups

In this report there are seven major comparisons on which the presentations of the results are based. First, 2011 findings are compared to the most recent findings of the MTF. As mentioned earlier, MTF is one of the primary national surveys on adolescent ATOD use and other problem behaviors and is considered the "gold standard" regarding national assessment of adolescent substance use. One limitation of the MTF survey is that data are collected only on 8 th, 10 th, and 12 th grade students.

Table 3-1 Substances and Prevalence Period Measured

| DRUG | PREVALENCE PERIOD |
| :--- | :--- |
| Alcohol | Lifetime, Past 30 Days,Binge in Past Two Weeks |
| Cigarettes | Lifetime, Past 30 Days |
| Smokeless Tobacco | Lifetime, Past 30 Days |
| Marijuana | Lifetime, Past 30 Days |
| Inhalants | Lifetime, Past 30 Days |
| Hallucinogens | Lifetime, Past 30 Days |
| Cocaine | Lifetime, Past 30 Days |
| Methamphetamines | Lifetime, Past 30 Days |
| Stimulants | Lifetime, Past 30 Days |
| Sedatives | Lifetime, Past 30 Days |
| Ecstasy | Lifetime, Past 30 Days |
| Heroin | Lifetime, Past 30 Days |
| Prescription Drugs | Lifetime, Past 30 Days |
| Over-the-Counter Drugs | Lifetime, Past 30 Days |
| Alcopops | Lifetime, Past 30 Days |
| Any Drug | Lifetime, Past 30 Days |

The 2011 APNA findings are also compared against previous APNA findings from 2006-2010. Long-term trend data are one of the most valuable resources for policy makers and prevention planners in regard to ATOD prevention efforts. Annual collection of APNA data gives tools to Arkansas prevention providers that are not always available in other states.

### 3.2 Age of Initiation

Arkansas youth were asked to report when, if ever, they first used ATODs. In calculating the average age of initiation, only data from those youth who had indicated they had used the substance were taken into account. As a result, the number of students included in these analyses is a fraction of those included in the other analyses.

Table 3-2 shows that youth begin using cigarettes before any other substance. Of the youth who had used cigarettes, the average age of first use was 12.3 years. A period of about 18 months separates the age of when the student reported first having more than a sip or two of alcohol and the first regular alcohol use, with the first use beyond a sip occurring at 12.7 years, and the first regular use of alcohol at 14.2 years. Of the youth who had used marijuana, the average age of first use was 13.7 years which was the same age reported in 2010.

First regular alcohol use age increased slightly to 14.2 for 2011 . Comparing 2006 results to this year's survey, the largest differences occur in first cigarette use ( 12.0 years in 2006 vs. 12.3 years in 2011) and first marijuana use ( 13.5 in 2006 vs. 13.7 in 2011). In both cases, students are waiting longer to try these substances; this could be indicative of a positive effect of prevention programming.

Table 3-2

| Drug Used | Ade of Initiation |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Average Age of First Use(Of Students Who Indicated That They Had Used) |  |  |  |  |  |
|  | 2006 | 2007 | 2008 | 2009 | 2010 | 2011 |
| First Cigarette Use | 12.0 | 12.1 | 12.1 | 12.1 | 12.2 | 12.3 |
| First Marijuana Use | 13.5 | 13.6 | 13.7 | 13.6 | 13.7 | 13.7 |
| First Alcohol More Than Sip | 12.5 | 12.6 | 12.6 | 12.6 | 12.7 | 12.7 |
| First Regular Alcohol Use | 14.1 | 14.1 | 14.1 | 14.1 | 14.1 | 14.2 |

Figure 3-1

### 3.3 Lifetime ATOD Use

### 3.3.1 Arkansas Results Compared to National Results

Lifetime use is recorded when a student reports that they have used a substance at least once in their lifetime. Lifetime use is typically viewed as the best measure of youth experimentation with alcohol ( $38.2 \%$ have used at least once), cigarettes (24.6\%), smokeless tobacco (14.1\%), marijuana ( $15.2 \%$ ), and inhalants ( $9.9 \%$ ). In each case, reported rates have declined since 2010 APNA results with the exception of marijuana which increased.

Overall, youth in Arkansas report rates of decline in ATOD use over the last several years that generally mirror the national sample. Tables 3-3 and 3-4, and Figure 3-2, show the lifetime ATOD use by Arkansas 8th, 10th, and 12th grade participants and compares it to MTF participants. Alcohol is by far the most frequently reported substance by Arkansas students. Lifetime prevalence of alcohol ranged from $12.9 \%$ for 6th graders to $65.9 \%$ for 12th grade students. Yet, fewer of Arkansas' 8th, 10th and 12th graders reported alcohol use than the MTF reports. (Table 3-4)

Compared to the national sample, Arkansas youth reported substantially less lifetime use in marijuana, LSD/hallucinogens, cocaine, stimulants, and ecstasy. However, Arkansas students reported higher lifetime experience with cigarettes and smokeless tobacco and 8,10 , and 12 th graders reported considerably greater use of sedatives compared to MTF reports for each of these grades. (Table 3-4)

Table 3-3 Difference in lifetime prevalence rates on directly comparable measures between Arkansas students and MTF 2011 findings.

|  | $\bar{\circ}$ $\frac{0}{\circ}$ $\frac{3}{4}$ |  |  |  |  | $\begin{aligned} & \stackrel{0}{40} \\ & \text { H0 } \\ & \hline 0 \\ & \hline \end{aligned}$ |  |  |  |  | Heroin/Opiates |  |

| Values above 0 (pink background) indicate Arkansas use above MTF value. Values below 0 (green background) indicate Arkansas use below MTF findings. |  |  |  |  |  |  |  |  |  |  |  |  |

### 3.3.2 2011 Results Compared to Previous Years' Results

Since the 2006 APNA survey, lifetime use of most substances by Arkansas youth has decreased, sometimes dramatically. Table 3-4 and Figure 3-2 show the long-term trend for lifetime prevalence for the most important ATOD substances for Arkansas students. The parallel trend for MTF is also shown. In general, the 2011 data show a continuing long-term reduction in ATOD experimentation by Arkansas youth.

While Table 3-4 shows that the long-term trend has been positive since 2006, this downward trend continues between 2010 and 2011 data for all grade levels although decreases are more moderate in 2011 than those found in 2010. Decreases ranged from $0 \%$ to $0.9 \%$ with the largest decreases found in cigarettes, alcohol and smokeless tobacco. Marijuana showed a small increase from $14.9 \%$ to $15.2 \%$.

| NOTE: Cells containing the -- symbol indicate an area where data is not available either due to the question not being asked in that years survey, or the MTF data is not comparable to the Arkansas data. To accurately compare MTF drug use to Arkansas drug use, Pride Surveys must have the MTF database. <br> NOTE: The Any Drug category includes all drugs that were included in the APNA that year. Therefore, the 2002 and 2003 Any Drug categories contain the percent of students reporting use any of the following drugs: marijuana, hallucinogens, cocaine, ecstasy, inhalants, or methamphetamines. The 2004 Any Drug category contains the percent of students reporting use of any of the following drugs: marijuana, hallucinogens, cocaine, ecstasy, inhalants, sedatives, or heroin. The 2005 thru 2007 Any Drug category contains the percent of students reporting use of the following drugs: marijuana, hallucinogens, cocaine, ecstasy, inhalants, sedatives, methamphetamines, stimulants, or heroin. While 2002 and 2003 Any Drug rates are comparable to each other, 2004 and 2005 thru 2007 rates should not be compared to each other or to 2002/2003 results, because the substances considered in each year's Any Drug data are not identical. The Any Drug category for 2008 was expanded to include the categories of prescription drugs and over-the-counter drugs. In 2009 the category of Alcopops was added but this substance is treated uniquely and is reported on separately from the alcohol categorv as it is considered a subcatecorv of alcohol. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Section 3:

### 3.3.3 Substance Use by Gender

Being male is generally considered a risk factor for substance use; males generally show higher levels of use. However, for Arkansas students in 2011, overall female substance use in six categories was higher than that reported by males: alcohol, inhalants, sedatives, prescription drugs, over-the-counter drugs, and alcopops. (Figure 3-3, Table 3-6 and Table 3-7) As is typically found, one of the largest percentage differences between genders was for smokeless tobacco use by 12 th grade boys who use smokeless tobacco at almost four times the rate of girls ( $38.8 \%$ vs. $10.5 \%$ ). Other differences are less dramatic. Since 2010, total lifetime use for all substances decreased slightly or remained the same for females with the exception of marijuana and alcopops which increased by $0.2 \%$ and $0.1 \%$ respectively. Males also exhibited a similar pattern with general decline in use with the exceptions of marijuana, hallucinogens, cocaine, sedatives which showed slight increases. Overall, the gradual decline of all substance use since 2006 for both males and females is a positive, long-term trend. While some increases were found, the amount of the increase was so small that they should be of little concern unless future data collection should indicate that there has been a shift in substance use behavior.

### 3.4 Past 30-Day ATOD Use

Past 30-day use is recorded when youth report that they have used a substance at least once in the past 30 days. Past 30-day use is typically viewed as the best measure of the ongoing use of alcohol, tobacco, and other drugs. The most commonly used substances for 2011 were alcohol, alcopops, cigarettes, marijuana and smokeless tobacco, in that order. Overall, Arkansas youth showed little or no change in their past 30-day prevalence rates in the 2011 survey compared to the 2010 survey.

### 3.4.1 Arkansas Students' Substance Use Compared to National Results

Table 3-5 summarizes the statewide Arkansas findings as they compare with the nationwide Monitoring the Future results. In this table, cells with pink shading indicate areas where Arkansas youth show higher prevalence rates than what are measured nationally. Cells with green shading indicate substances where Arkansas youth have a lower prevalence rate than for students nationally.

subcateqorv of alcohol.

Table 3-8 shows that Arkansas youth compared to MTF respondents have slightly higher rates of use of tobacco products. The higher prevalence of tobacco is common in many states in the Southeast. This is due to a variety of cultural and economic factors in the southeastern United States that have traditionally supported greater tobacco use. Arkansas youth are also somewhat higher in their use of inhalants and sedatives across all grades.

On the positive side, Arkansas youth showed lower levels of use on a number of other substances, including alcohol, marijuana, hallucinogens, cocaine, stimulants, and MDMA (Ecstasy). These advantages ranged from $<1 \%$ to $5 \%$ for 12th grade alcohol use.

Table 3-8 shows more details on the past 30-day results for all substances by grade level, with the results compared to MTF results. The most commonly used substances in the past 30 days were alcohol, alcopops, cigarettes, marijuana, and smokeless tobacco, in that order. Sedatives, inhalants, prescription drugs, and over-the-counter drugs were the other four substances that showed prevalence rates above $2 \%$. Figure $3-4$ shows the past 30 -day prevalence rates for alcohol, cigarettes, marijuana, inhalants, and smokeless tobacco.

### 3.4.2 Arkansas Students' 30-Day Substance Use in 2011 Compared to Previous Years

Comparison of the 2011 APNA findings with the 2006-2010 surveys are also presented in Table 3-8 and Figure 3-4. Past 30-day use of all substances has decreased or remained stable since the 2010 survey, as well as from 2006. Alcohol, alcopops, and marijuana showed increases of $0.1 \%, 0.1 \%$ and $0.3 \%$ respectively. Again, as with the lifetime use, these increases are very small and should be of concern only if future data collection should indicate a change in the general trend.

### 3.4.3 Past 30-Day Use by Gender

Tables 3-9 and 3-10 show the percentage of ATOD use in the past 30 days by males and females in the four grades and the total for all males and all females. Figure $3-5$ graphically portrays the same data for selected substances.

As with male and female lifetime usage rates, past-month use was generally similar for males and females; however, there are some differences worth mentioning, particularly at the 12 th grade level. The past 30 -day prevalence rate of smokeless tobacco was notably higher for males than females at the 12th grade level ( $19.6 \%$ vs. $2.5 \%$ ), but the 10 th, 8 th and 6 th grade students also showed the same pattern. Comparing males to females in the 12th grade, there was a $6.5 \%$ higher alcohol prevalence rate for males, a $7.9 \%$ higher cigarette rate, and a $7.1 \%$ higher marijuana rate. In general, these past 30-day prevalence patterns are more typical of what is found, with males generally showing higher prevalence rates. Sedatives, inhalants, prescription and over-the-counter drugs and alcopops use by females are the only drug category where girls reported higher rates than boys.

While males generally reported higher levels of substance use, it is worth noting again that the overall prevalence rates are similar to the previous year with little to no change in either direction.

NOTE: Cells containing the -- symbol indicate an area where data is not available either due to the question not being asked in that years survey, or the MTF data is not comparable to the Arkansas data. To accurately compare MTF drug use to Arkansas drug use, Pride Surveys must have the MTF database.
NOTE: The Any Drug category includes all drugs that were included in the APNA that year. Therefore, the 2002 and 2003 Any Drug categories contain the percent of students reporting use any of the following drugs: marijuana, hallucinogens, cocaine, ecstasy, inhalants, or methamphetamines. The 2004 Any Drug category contains the percent of students reporting use of any of the following drugs: marijuana, hallucinogens, cocaine, ecstasy, inhalants, sedatives, or heroin. The 2005 thru 2007 Any Drug category contains the percent of students reporting use of the following drugs: marijuana, hallucinogens, cocaine, ecstasy, inhalants, sedatives, methamphetamines, stimulants, or heroin. While 2002 and 2003 Any Drug rates are comparable to each other, 2004 and 2005 thru 2007 rates should not be compared to each other or to 2002/2003 results, because the substances considered in each year's Any Drug data are not identical. The Any Drug category for 2008 was expanded to include the categories of prescription drugs and over-the-counter drugs. In 2009 the category of Alcopops was added but this substance is treated uniquely and is reported on separately from the alcohol category as it is
considered a subcategorv of alcohol.

Figure 3-5

### 3.5 Special Topics in Substance Use

A number of special topics are important to student ATOD use. Heavy ATOD use (3.5.1) and the simultaneous use of multiple substances (3.5.2) are informative to prevention planners and policy makers, both for assessing the current prevalence of serious use but also for predicting future treatment needs. Several topics are predictive of general use in adolescence. These include: age of initiation (3.2), perceived harmfulness (3.5.4), intention to use (3.5.5), perceived availability (3.5.6), depression and substance use (3.5.9), and parental characteristics and substance use (3.5.7). Specific prevention strategies can be applied at the community level if these issues are found to be of local concern. Of particular interest to prevention practitioners involved with environmental strategies to prevent ATOD use, information related to the sources and locations of alcohol use (3.5.3) is useful. Finally, of importance to schools is an examination of the relationship between ATOD use and academic performance (3.5.8).

### 3.5.1 Heavy Alcohol, Cigarette, and Marijuana Use

The 2011 APNA survey measured heavy use for alcohol, cigarettes, and marijuana. These are the substances that all students, both in Arkansas and nationally, are most likely to use heavily.

Overall, binge drinking appears to be the largest heavy use problem among Arkansas youth. Binge drinking is unique in that the measured prevalence period is the past two weeks. The students are asked on the survey "Think back over the last two weeks. How many times have you had five or more alcoholic drinks in a row?" Table 3-11 shows that $10.0 \%$ of youth reported binge drinking at least once in the past two weeks. This was an increase of $0.1 \%$ from the 2010 results. Compared to 2006 findings, binge drinking in Arkansas youth has declined by $5.4 \%$, which is a substantial fraction of the $15.4 \%$ prevalence rate that was found in 2006 . As is typical for most
substances, binge drinking increases predictably for Arkansas students as they progress through middle and high school.

Heavy use of tobacco was measured by the question "How frequently have you smoked cigarettes during the past 30 days?" Response options ranged from "Not at All" to "Two packs or more per day." Heavy cigarette use was defined as about one-half pack per day or more. Table 3-11 shows the results for heavy tobacco use. The findings show that heavy use was relatively low, $<1.0 \%$ of all Arkansas students.

Heavy marijuana use was measured by the question: "During the last month, about how many marijuana cigarettes, or the equivalent, did you smoke a day, on the average?" Response options ranged from "None" to " 11 or more a day." Heavy use was defined as reporting use of one or more marijuana cigarettes a day. The findings (Table 3-11) show a prevalence rate of 5.1\% for all Arkansas students, with $10.4 \%$ of 12th graders reporting heavy marijuana use. This is a small $(<1 \%)$ increase from the previous year.

Male-female differences also are observed with the heavy use of ATOD substances. Figure 3-6 and Tables 3-12 and 3-13 show that, overall, males engage in these behaviors more than females. The largest difference is a $5.9 \%$ higher prevalence rate in boys vs. girls for 12 th grade binge drinking. The difference in binge drinking decreases by $0.3 \%$ in the 10 th grade; however, more 8th grade girls reported binge drinking than 8th grade boys ( $6.1 \%$ vs $5.4 \%$, respectively). In the 12 th grade, $13.1 \%$ of boys report heavy marijuana use, while $7.9 \%$ of girls report the same. Again, this difference decreases somewhat in the 10th grade. There is relatively little difference between boys and girls in heavy cigarette use, but again the boys have the higher prevalence value at all grade levels.

Figure 3-6

### 3.5.2 Simultaneous Use of Multiple Substances

The percentage of youth who used various substances individually and in combination with other substances is shown in Table 3-14. "Any Substance" is defined as using one or more of the 15 substances measured by the survey. The data shown are all based on a past 30 -day prevalence period. As is typical, the prevalence rates increase with grade level. The combined grade prevalence rate is shown in the far right column. For easier reference, the overall percentage of students using alcohol, tobacco, and marijuana are also shown.

A substantial number of students report using two or more and three or more substances. Across all grades, $13.1 \%$ of Arkansas youth have used two or more substances in the past 30 days, and $7.1 \%$ have used three or more substances. Compared to 2010 reports, these rates have decreased by $0.1 \%$ for two or more substances and remain the same for three or more substances. The most common combinations are that of alcohol and tobacco (7.2\%), and alcohol and any other drug, where $7.6 \%$ of Arkansas youth overall report using both in the past 30 days. Nearly as frequent (5.6\%) was the combination of tobacco with another drug (not including alcohol). Use of all three substances - alcohol, tobacco, and marijuana, within the past 30 days was reported by $3.3 \%$ of all students.

Table 3-14

### 3.5.3 Sources of Alcohol and Location of Alcohol Use

Tables 3-15 and 3-16 provide data related to sources and places of alcohol use for Arkansas youth, if they used at all. Figure 3-7 shows where students usually obtained alcohol, and Figure 3-8 shows the place where they usually used alcohol. While youth using alcohol may have obtained alcohol in various ways and used alcohol in various locations, they were asked to select the one best answer that typically described their method for obtaining alcohol and the place where they usually drank alcohol.

Across all grades, the most prominent source of alcohol among Arkansas youth was from someone 21 years of age or older. This source becomes increasingly used as youth progress from the 6th grade ( $1.0 \%$ obtained alcohol from someone 21 years of age or older) to the 12th grade ( $25.3 \%$ obtained alcohol from someone 21 years of age or older). The next most prominent sources were getting it from home with parents permission (3.8\%), getting alcohol from someone the student knew under age 21 (3.7\%), getting it from a relative or at home without parent's permission (2.4\%), and "other" (5.5\%). As might be expected, the percentage of students reporting each of these sources increases with grade level.

Encouragingly, buying alcohol-with or without a fake ID-was rare. Only $0.1 \%$ of 6th graders, $0.2 \%$ of 8 th graders, $0.3 \%$ of 10 th graders, and $0.6 \%$ of 12th graders indicated that they obtained alcohol by buying it with a fake ID and $1.6 \%$ of 12th graders who bought alcohol said they did not use a fake ID.

When consuming alcohol, students in the 8th, 10th, and 12th grade indicated that they most often drank alcohol at someone else's house. Students became more likely to drink at someone else's house as they advance in grade ( $1.6 \%$ in the 6 th grade, $8.4 \%$ in the 8 th grade, $20.9 \%$ in the 10 th grade, and $32.9 \%$ in the 12 th grade). The second most popular place where youth drank was at their home $(3.3 \%$ in the 6 th grade, $8.6 \%$ in the 8 th grade, $12.6 \%$ in the 10 th grade,
and $12.2 \%$ in the 12th grade). The likelihood of drinking in an open area, a sporting event or concert, a restaurant, bar, or club, a hotel or motel, in a car, and at school were much less common locations for consuming alcohol, and all increased with grade level. This pattern of use is essentially the same as last year.

A separate question on the survey asked students about whether they had been drunk or high at school in the past year. This is a hybrid question in the sense that it is asking about location (i.e., school setting), the level of use (being drunk or high), and multiple substances (drunk or high). Because of the format of the specific question, the reported percentages for this behavior are based on a past year prevalence period, which makes them more difficult to directly compare with other ATOD questions. Nevertheless, the prevalence for being drunk or high at school in the past year is smaller than the past 30-day prevalence rate for alcohol use, or the past two-week prevalence period for binge drinking. Specifically, by grade level, the percentage of students who said they had ever been drunk or high at school in the past year was $1.6 \%, 6.7 \%, 13.9 \%$, and $17.7 \%$ for 6th, 8 th, 10 th, and 12 th graders, respectively. (Figure 3-9) These values are slightly lower than last year with the exception of the 12th grade which is slightly higher.

### 3.5.4 Perceived Harmfulness

When youth perceive that a substance is harmful, they are less likely to use it. The APNA survey asked youth, "How much do you think people risk harming themselves (physically or in other ways) if they" smoked cigarettes heavily, tried marijuana, smoked marijuana regularly, drank alcohol regularly, or engaged in binge drinking regularly. Students reported that the previously named substance categories placed them at "No Risk," "Slight Risk,"
"Moderate Risk," or "Great Risk." The results are presented in Table 3-17 and Figures 3-10, 3-11 and 3-12.

In the 8th, 10th, and 12th grades, where comparisons with MTF are possible, more or an equal percentage of Arkansas students than national MTF survey participants perceived great risk for most of the five categories.

However, this advantage for Arkansas students was lost at some grade levels for some of the categories. For example, fewer Arkansas students in grades 8,10 , and 12 thought drinking 5 or more drinks once or twice a weekend placed people at great risk compared to MTF students, with the largest difference found in the 10th grade ( $48.7 \%$ for Arkansas students vs. 55.5\% for MTF students). Perceived great risk in smoking one or more packs of cigarettes per day was also lower among Arkansas grade 12 students ( $69.1 \%$ vs. $77.0 \%$ ).

### 3.5.5 Intention to Use

Youth were asked whether they would use cigarettes, alcohol, or marijuana when they became an adult. The response categories were NO!, no, yes, and YES! The percentages of youth in each grade answering "YES" or "yes" to the questions are listed in Table 3-18 and Figure 3-13.

As can be seen, a majority of the youth do not intend to use cigarettes or marijuana, although $59.0 \%$ of high school seniors intend to use alcohol.
This intention rate for alcohol closely mirrors actual adult alcohol use in the United States.

The intention to use all substances increases as youth get older. Intention to use cigarettes, alcohol, marijuana, and other illegal substances in 2011 peaks in the 12th grade. However, this is not the complete story. More critical is
the rapid increase in intentions that occurs in the 8th through 10th grades. The increase in intentions between the 8th and 10th grades, is larger than the increase between the 10th and 12th grades.

Just as with substance use rates, youth intentions to use ATODs increased the most after the 6th grade. From the 6th grade to the 8th grade, intention to smoke cigarettes more than doubled (from $3.2 \%$ in the 6th grade to $76.4 \%$ in the 8th grade), intention to drink alcohol more than doubled (from $15.9 \%$ in the 6th grade to $35.8 \%$ in the 8 th grade), and intention to smoke marijuana increased from $1.2 \%$ to $6.7 \%$ in the 8 th grade. These data clearly point out the critical need for prevention programs early in adolescence.
Youth need prevention programs prior to the onset of substance use and then at regular intervals to maintain low rates of substance use and intention to use. Once the students are in the 12th grade, the decisions to use or not use have likely been made.

Table 3-18

| Percentage of Youth with Intention to Use ATODs |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Figure 3-13

### 3.5.6 Academic Performance and Substance Use

A strong correlation between substance use and academic performance was found in the 2011 APNA survey (Table 3-19 and Figure 3-14). Of the youth who reported getting better grades, fewer have tried ATODs and fewer are currently using ATODs than those who report poorer grades. Failing (earning grades of D or F ) youth are two and a half times more likely to have used alcohol in the past 30 days, six times more likely to have used cigarettes in the past 30 days, about six times more likely to have used marijuana in the past 30 days, and three times more likely to have used any drug in the past 30 days than youths receiving grades of A .

It is likely that the youth earning As are more invested in the education process and more bonded to school than their peers receiving poorer grades. One of the challenges for prevention programs is to develop methods of keeping all youth interested in learning and feeling attached to school.

## Table 3-19

| Percentage Using ATODs by Academic Performance (2011) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Drugs Used | Academic Performance |  |  |  |
|  | Mostly A's | Mostly B's | Mostly C's | Mostly D's <br> or F's |
| Alcohol Lifetime | 28.5 | 41.9 | 49.9 | 49.9 |
| Alcohol 30 Days | 10.6 | 17.6 | 23.9 | 26.2 |
| Marijuana Lifetime | 7.9 | 16.3 | 25.7 | 30.1 |
| Marijuana 30 Days | 3.2 | 7.4 | 13.0 | 16.6 |
| Cigarettes Lifetime | 13.8 | 26.7 | 38.2 | 44.8 |
| Cigarettes 30 Days | 3.8 | 9.2 | 15.9 | 21.2 |
| Any Drug Lifetime | 18.6 | 28.8 | 38.1 | 42.0 |
| Any Drug 30 Days | 8.5 | 14.7 | 21.8 | 26.9 |

Figure 3-14

### 3.5.7 Depressive Symptoms and Substance Use

The substance use rate of youth who reported depressive symptoms is much greater than those who have a more positive outlook on life. The four items to assess depressive symptoms on the survey questionnaire were: 1) Sometimes I think that life is not worth it; 2) At times I think I am no good at all; 3) All in all, I am inclined to think that I am a failure; and 4) In the past year, have you felt depressed or sad MOST days, even if you felt OK sometimes? The questions were scored on a scale of 1 to 4 (NO!, no, yes, YES!). The survey respondents were divided into three groups. Those who scored a mean of greater than 3.75 were categorized as depressed. These youth marked "YES!" to all four items or marked "yes" to one item and "YES!" to three. Those who marked "NO!" to all four items were categorized as optimistic; a middle category was assigned to all remaining respondents. According to this methodology, the APNA survey categorized 3,709 (4.0\%) youth as depressed, 16,106 (18\%) youth as optimistic and 67,657 (75\%) youth in the middle category. (Table 3-20)

A strong link exists between youth who reported depressive symptoms and ATOD use. When compared to the optimistic group, the depressed youth were more than two times as likely to use alcohol in the past 30 days ( $30.5 \%$ vs. $12.2 \%$ ), four times as likely to use cigarettes in the past 30 days ( $23.3 \%$ vs. $6.0 \%$ ), more than three times as likely to use marijuana in the past 30 days ( $16.9 \%$ vs. $4.9 \%$ ), and nearly five times as likely to have used any drug in the past 30 days ( $38.1 \%$ vs. $7.4 \%$ ).

The ATOD use rates of the youth in the middle group, comprising most youth, were closer to the rates of the optimistic group than they were to the depressed. For example, for past 30-day alcohol use, the prevalence rates were $12.2 \%, 16.5 \%$ and $30.5 \%$ for the optimistic, middle, and depressed groups, respectively. In short, individuals with a positive outlook on life (even with some depressive symptoms) tend to use fewer substances than students with a high level of depressive symptoms.

Table 3-20

| Percentage Using ATODs and Level of Depressive Symptoms (2011) |  |  |  |
| :--- | :---: | :---: | :---: |
|  | Level of Depressive Symptoms |  |  |
|  | Optimistic | Middle | Depressed |
| Number of Youth | 16,106 | 67,657 | 3,709 |
| Alcohol Lifetime | 27.7 | 39.5 | 62.6 |
| Alcohol 30 Days | 12.2 | 16.5 | 30.5 |
| Marijuana Lifetime | 10.9 | 15.4 | 32.6 |
| Marijuana 30 Days | 4.9 | 7.1 | 16.9 |
| Cigarettes Lifetime | 15.9 | 25.2 | 50.8 |
| Cigarettes 30 Days | 6.0 | 8.7 | 23.3 |
| Any Drug Lifetime | 15.8 | 28.0 | 57.2 |
| Any Drug 30 Days | 7.4 | 14.3 | 38.1 |

Figure 3-15
Percentage Using ATODs and Level of Depressive Symptoms (2011)

## Section 4: Behavioral Outcomes Other Than Substance Use

### 4.1 Introduction to the Measurement of Antisocial Behavior

In the APNA, antisocial behavior is measured through two different sets of questions. First, a series of questions asks students whether they engaged in six specific behaviors in the past year (carrying a handgun, taking a handgun to school, selling illegal drugs, vehicle theft, attacking someone with the intention of seriously hurting them, or having been drunk or high at school); and, also for the past year, whether they were suspended from school or arrested. Second, in another series of questions, students were asked the age at which the following events or behaviors first happened: school suspension, arrest,
carrying a handgun, attacking someone with the intent of seriously hurting them, and gang involvement. The format of the age of initiation questions allows for lifetime prevalence to be derived for these specific behaviors.

Table 4-1 summarizes the prevalence of the antisocial behavior variables measured for the past year. Tables 4-2 and 4-3 provide a breakdown of male/ female responses to these questions. Figures 4-1 and 4-2 graphically present the same information.

In the following subsections, specific antisocial behaviors are discussed in greater detail, and age of initiation questions are presented in Section 4.3.

Table 4-1

| Percentage of APNA Respondents (Grades 6, 8, 10, and 12 combined) who Engaged in Antisocial Behavior in the Past Year |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Figure 4-1

Figure 4-2

### 4.2 Antisocial Behavior During the Past Year

### 4.2.1 School Suspension

Students were asked whether they had been suspended from school in the past year. Overall, $12.3 \%$ of students reported that they had been suspended from school. Students in 8th and 10th grades were most likely to report suspension. There has been relatively little variation in this behavior over several years, and 2011 results are slightly lower than 2010 results (Table 4-1).

### 4.2.2 Carrying a Handgun/Taking a Handgun to School

The issue of youth carrying handguns is a serious concern for communities, schools, and families. The APNA survey has two questions about antisocial behaviors related to handguns as shown in Table 4-1. Most of the responses show a low percentage of students who carry handguns or take them to school. For example, $0.7 \%$ of the youth surveyed reported taking a handgun to school in the past 12 months, and $4.4 \%$ of youth surveyed reported carrying a handgun in the past 12 months. The results from these two questions must be interpreted differently. Taking a handgun to school is, under any circumstances, an extremely deviant event. The extremely low percentage of youth reporting this behavior is encouraging. In fact, with the overall prevalence measurement this low, this is well below the range of the survey to reliably detect the true prevalence.

On the other hand, carrying a handgun is not necessarily a deviant act. Under proper supervision, the use of a handgun by a 6th through 12th grade student is not of concern. The larger percentage of students reporting this event is also within normal bounds and not of immediate concern.

Both of these survey questions also show grade-related effects. When looking at the results by grade, 10th and 12th graders reported the highest rate of taking a handgun to school in the past year ( $0.9 \%$ and $1.1 \%$, respectively) and carrying a handgun in the past year ( $4.7 \%$ and $5.0 \%$, respectively). Again, however, the very low percentage values for taking a handgun to school indicate that the behavior is infrequent enough that it is very difficult for the survey to reliably estimate the true prevalence. Eighth graders reported taking a gun to school and carrying a hand gun in the past year at the rates of $.6 \%$ and $4.4 \%$, respectively.

Fluctuations of rates across the 2006-2011 time span have been small, with the prevalence rates remarkably stable. Variations from year-to-year of $1 \%$ or less are not meaningful.

### 4.2.3 Selling Illegal Drugs

Students were asked about whether they had sold illegal drugs, by answering the question "How many times in the past year ( 12 months) have you sold illegal drugs?" Overall, $3.4 \%$ of Arkansas students reported that they had sold illegal drugs in the past year. As is typical, the percentage reporting that they had sold drugs increased with grade level, from $0.2 \%$ in the 6th grade to $7.8 \%$ in the 12 th grade. These results are very similar to both 2010 results and for the findings since 2006.

### 4.2.4 Vehicle Theft

Students were asked about whether they had stolen a vehicle, by answering the question "How many times in the past year ( 12 months) have you stolen or tried to steal a motor vehicle such as a car or motorcycle?" Overall, very few students, $1.7 \%$, reported that they had stolen a vehicle in the past year. There is only a slight rise in the prevalence of this behavior with age and, in
fact, the percentage of 12th graders reporting this behavior (1.7\%) is lower than the 10 th grade ( $2.3 \%$ ). These results are essentially unchanged since 2010, and have not fluctuated much since 2006.

### 4.2.5 Arrest

Arrest is not actually a behavior, but a consequence of problem behavior. Its prevalence can be measured like all other antisocial events. As with other antisocial behaviors, the students were asked whether they had been arrested in the past 12 months. Students' interpretations of exactly what the survey question means may vary as they age. Adults think of arrest as a formal detainment with legal consequences. Sixth graders, on the other hand, will mistakenly believe that they have been "arrested" when a much less formal and much more frequent interaction with a police officer, such as a field interview, has occurred. As adolescents mature they acquire a greater understanding and sophistication; what they would have counted as an arrest when they answered the survey at age 11 no longer qualifies at age 16 or 17. Nevertheless, relying on the interpretation of the trend of the results over time, this question is a good marker for current antisocial behavior.

Across all the surveyed grade levels, a total of $4.3 \%$ of Arkansas students reported that they were arrested in the past year. Arrest prevalence peaked in the 12 th grade, with $6.1 \%$ of students. Tenth graders had the second highest level, at $6.0 \%$, followed by 8th graders ( $4.3 \%$ ) and 6th graders (1.6\%). These figures parallel 2010 findings. As with the other antisocial behaviors, the prevalence rates have been very stable since 2006.

### 4.2.6 Attacking Someone With the Intention of Seriously Hurting Them

A review of the 2011 data reveals that $13.1 \%$ of the youth in Arkansas have attacked someone with the idea of seriously hurting them in the past 12 months. This is the lowest prevalence rate since 2006. And, 2011 findings are lower than the 2010 findings for each grade level.

When looking at the results by grade, it appears that 8 th and 10 th graders have the most problems with violent behavior and attitudes. This is typical of adolescent populations. 8th graders reported the highest rates of attacking someone in the past 12 months ( $14.8 \%$ ), followed by 10 th graders ( $14.3 \%$ ).

### 4.2.7 Gang Involvement

Overall, $6.1 \%$ of Arkansas students reported that they belonged to a gang sometime in their lifetime. Students' understanding of this question varies depending on their definition of a gang, but it is the ongoing trend data that make this question useful. The $6.1 \%$ prevalence rate compares to a $6.9 \%$ prevalence in 2010, and an $8.2 \%$ prevalence in 2006. (Table 4-1.)

There is not much variation in the prevalence rate by grade level for this question. The rates for 6 th, 8 th, 10 th, and 12 th grade students were $4.7 \%$, $6.9 \%, 6.4 \%$ and $6.3 \%$, respectively. A small decrease was reported for each grade level between 2010 and 2011.

While the increase in gang involvement from 2007 to 2008 may have signaled a trend worth watching, the 2011 data bring prevalence rates to the lowest rate across the years for all grades.

### 4.3 Age of Initiation of Antisocial Behavior

Age of initiation questions ask students about their age when they first engaged in a specific behavior or about their age when a specific event (e.g., school suspension) first occurred. Table 4-4 and Figure 4-3 show results from the age of initiation questions. These data are based only on students who reported the events had happened; students who did not report that the events had happened are excluded from this data.

### 4.3.1 School Suspension

The average age for first being suspended from school was 11.9. The 2011 results are almost identical to 2007 thru 2010 results.

### 4.3.2 Arrest

The average age for arrest for Arkansas students was 13.5, and is similar to results from 2007 thru 2010.

### 4.3.3 Carrying a Handgun

The average age that Arkansas students started carrying a handgun was 12.2 years. This value is similar to previous years, except 2006.

### 4.3.4 Attacking Someone with the Intent of Seriously Hurting Them

The average age for Arkansas students attacking someone with the intent of seriously hurting them was 12.1 years; this finding is a $0.1 \%$ decrease from the previous year which had remained steady since 2007.

### 4.3.5 Age of Initiation for Gang Involvement

The 2011 results showed slight variation for this indicator, with its range of 12.2 for $2011,12.4$ in 2010 to 12.3 in $2009,12.5$ in 2008 , and 12.4 in 2007.

## 1 INTRODUCTION

This report summarizes findings from the Arkansas Prevention Needs Assessment Survey (APNA), a survey of 6th, 8th, 10th and 12th grade school students, conducted in the fall of 2011. This survey was available free of charge to all Arkansas public school districts that chose to participate. The survey was designed to assess adolescent substance use and related behaviors, and risk and protective factors that predict these behaviors. In this report, the results are presented for each grade along with the overall results for the State. Table 1 provides information on the total number of students, the number of school districts and the number of schools represented by this report. Table 2 provides information on the number and percent of students at each grade. Table 3 provides information on the number and percent of students by sex. Table 4 provides information on the number and percent of students by ethnic origin.

The APNA Survey was first administered in the fall of 2002 and has been administered in the fall of each school year since then. Because trends over time are very important to prevention planning, readers are encouraged to review the results from the previous surveys. By comparing the results of the previous surveys, changes in ATOD (alcohol, tobacco and other drugs) use, rates of ASB (antisocial behavior), and levels of risk and protective factors can be determined for a specific grade. It is important to note that the results in this report are for students who were not sampled in the even grades $(6,8,10$, and 12 ) during the previous year's survey. Those students are now in grades $7,9,11$ or are out of school. Together, the results of the current and past APNA surveys provide a complete picture of ATOD use, antisocial behavior, risk, and protection for students in Arkansas.
(Methods Note Regarding Long-Term Trend Data:) The 2006 procedures varied from those used in this report, as well as those used in all other earlier reports. Nonstandard procedures for calculating: 1) drug prevalence rates, and 2) for calculating scores on the risk and protective factor questions, were used in the 2006 report. The variation in 2006 procedures related to how missing data (i.e., instances where the student did not respond to a question) were counted. The effect of the 2006 procedure was to slightly reduce the reported prevalence levels for all drugs, and to lower the calculated scores for the risk and protective factor questions.

In this report, the computational methods used for all calculations are identical to those used in all prior reports, other than the 2006 report. In addition, to produce the most accurate long-term trend data possible, 2006 results have been recalculated using standard procedures consistent with all reporting years. This means that, in some cases, small deviations in 2006 data points will be noted between this report and the actual 2006 report.

### 1.1 The Risk and Protective Factor Model of Prevention

Risk and protective factor-focused prevention is based on a simple premise: To prevent a problem from happening, we need to identify the factors that increase the risk of that problem developing and then find ways to reduce the risks. Just as medical researchers have found risk factors for heart attacks such as diets high in fats, lack of exercise, and smoking, a team of researchers, the Social Development Research Group (SDRG), at the University of Washington, have defined a set of risk factors for drug abuse. The research team also found that some children exposed to multiple risk factors manage to avoid behavior problems later even though they were exposed to the same risks as children who exhibited behavior problems. Based on research, they identified protective factors and processes that work together to buffer children from the effects of high risk exposure and lead to the development of healthy behaviors.

Risk factors include characteristics of school, community, and family environments, as well as characteristics of students and their peer groups that are known to predict increased likelihood of drug use, delinquency, and violent behaviors among youth (Hawkins, Catalano \& Miller, 1992; Hawkins, Arthur \& Catalano, 1995; Brewer, Hawkins, Catalano \& Neckerman, 1995).

## 2 TOOLS FOR ASSESSMENT AND PLANNING

Protective factors exert a positive influence or buffer against the negative influence of risk, thus reducing the likelihood that adolescents will engage in problem behaviors. Protective factors, identified through research reviewed by the Social Development Research Group, include social bonding to family, school, community and peers; and healthy beliefs and clear standards for behavior.

Research on risk and protective factors has important implications for prevention efforts. The premise of this approach is that in order to promote positive youth development and prevent problem behaviors, it is necessary to address those factors that predict the problem. By measuring risk and protective factors in a population, specific risk factors that are elevated and widespread can be identified and targeted by preventive interventions that also promote related protective factors. For example, if academic failure is identified as an elevated risk factor in a community, then mentoring and tutoring interventions can be provided that will improve academic performance, and also increase opportunities and rewards for classroom participation.

Risk and protective factor-focused drug abuse prevention is based on the work of J . David Hawkins, Ph.D., Richard F. Catalano, Ph.D.; and a team of researchers at
the University of Washington in Seattle. Beginning in the early 1980's, the group researched adolescent problem behaviors and identified risk factors for adolescent drug abuse and delinquency. The chart below shows the links between the 16 risk factors and the five problem behaviors. The check marks have been placed in the chart to indicate where at least two well designed, published research studies have shown a link between the risk factor and the problem behavior.

## 3 SCHOOL IMPROVEMENT USING SURVEY DATA

Data from the Arkansas Prevention Needs Assessment Survey can be used to help school and community planners assess current conditions and prioritize areas of greatest need.

Each risk and protective factor can be linked to specific types of interventions that have been shown to be effective in either reducing the risk(s) and enhancing the protection(s). The steps outlined below will help your school and community make key decisions regarding allocation of resources, how and when to address specific needs, and which strategies are most effective and known to produce results.

### 3.1 What are the numbers telling you?

Review the charts and data tables presented in this report. Using the table in section 3.3, note your findings as you discuss the following questions

- Which 3 to 5 risk factors appear to be higher than you would want?
- Which 3 to 5 protective factors appear to be lower than you would want?
- Which levels of 30 day drug use are increasing and/or unacceptably high?
- Which substances are your students using the most?
- At which grades do you see unacceptable usage levels?
- Which levels of antisocial behaviors are increasing and/or unacceptably high?
- Which behaviors are your students exhibiting the most?
- At which grades do you see unacceptable behavior levels?

### 3.2 How to decide if a rate is "unacceptable."

- Look across the charts to determine which items stand out as either much higher or much lower than the others.
- Compare your data to statewide data and national data. Differences of $5 \%$ or more between the local and other data should be carefully reviewed.
- Determine the standards and values held in your area. For example: Is it acceptable in your community for $75 \%$ of high school students to drink alcohol regularly even when the statewide percentage is 90 ?

### 3.3 Use these data for planning:

- Substance use and antisocial behavior data - raise awareness about the problems and promote dialogue.
- Risk and protective factor data - identify exactly where the community needs to take action.
- Promising approaches - talk with resources listed on the last page of this report for ideas about programs that have been proven effective in addressing the risk factors that are high in your area, and in improving the protective factors that are low.

| Measure | Unacceptable <br> Rate \#1 | Unacceptable <br> Rate \#2 | Unacceptable <br> Rate \#3 | Unacceptable <br> Rate \#4 |
| :--- | :---: | :---: | :---: | :---: |
| 30 Day |  |  |  |  |
| Drug Use |  |  |  |  |
| Antisocial |  |  |  |  |
| Behavior |  |  |  |  |
| Risk |  |  |  |  |
| Factors |  |  |  |  |
| Protective <br> Factors |  |  |  |  |

## How do I decide which intervention(s) to employ?

- Strategies should be selected based on the risk factors that are high in you community and the protective factors that are low.
- Strategies should be age appropriate and employed prior to the onset of the problem behavior
- Strategies chosen should address more than a single risk and protective factor
- No single strategy offers the solution.

## How do I know whether or not the intervention was effective?

- Participation in the annual administration of the survey provides trend data necessary for determining the effectiveness of the implemented intervention(s) and also provides data for determining any new efforts that are needed.

## 4 HOW TO READ THE CHARTS AND TABLES

1. Student responses for risk and protective factors, substance use and antisocial behavior questions are displayed by grade on the following pages.
2. The factors are grouped into 4 domains: community, family, peer-individual, and school.
3. The bars represent the percent of students in the grade who reported elevated risk or protection, substance use, antisocial behaviors or school safety concerns.
4. Scanning across these charts, you can easily determine which factors are most (or least) prevalent, thus identifying which are the most important for your community to address.
5. Bars will be complemented by a small dot. The dot shows the comparison from the state and provides additional information for you in determining the relative importance of each risk or protective factor.
6. A dashed line on each risk and protective factor chart represents the percentage of youth at risk or with protection for the seven state sample upon which the cut-points were developed. The seven states included in the norm group were Colorado, Illinois, Kansas, Maine, Oregon, Utah and Washington. This gives you a comparison to a national sample.
7. Brief definitions of the risk and protective factors can be found following the graphs.
8. The tables provide more detailed information and are broken down by grade level. The combined category consists of all the grade levels represented in this report combined together (ie. if the report is based on 10th and 12th graders then the combined category will be all the 10th and 12th graders combined). For the tables on substance use, some substances also have a comparison to the Monitoring the Future (MTF) data. Monitoring the Future is an annual federally funded national survey of substance use across the country for students in grade 8, 10 and 12. For some substances and for some years or some grades, there is no corresponding MTF data.
9. The following abbreviations are sometimes used in the tables and charts due to space constraints:

ATOD stands for Alcohol, Tobacco and Other Drug Use.
ASB stands for Antisocial Behaviors.
PSI stands for Prosocial Involvement
MTF stands for Monitoring the Future.

Table 5: Risk and Protective Factor Scale Definition

| Community Domain Risk Factors |  |
| :--- | :--- |
| Low Neighborhood <br> Attachment | A low level of bonding to the neighborhood is related to higher <br> levels of juvenile crime and drug selling. |
| Community <br> Disorganization | Research has shown that neighborhoods with high population <br> density, lack of natural surveillance of public places, physical <br> deterioration, and high rates of adult crime also have higher <br> rates of juvenile crime and drug selling. |
| Laws and Norms <br> Favorable Toward <br> Drug Use | Research has shown that legal restrictions on alcohol and to- <br> bacco use, such as raising the legal drinking age, restricting <br> smoking in public places, and increased taxation have been fol- <br> lowed by decreases in consumption. Moreover, national surveys <br> of high school seniors have shown that shifts in normative atti- <br> tudes toward drug use have preceded changes in prevalence of <br> use. |
| Perceived Availability <br> of Drugs | The availability of cigarettes, alcohol, marijuana, and other il- <br> legal drugs has been related to the use of these substances by <br> adolescents. |
| Perceived Availability <br> of Handguns | The availability of handguns has also been related to the use of <br> these substances by adolescents. |
|  | Community Domain Protective Factors |
| Opportunities for <br> Prosocial <br> Involvement | When opportunities are available in a community for positive <br> participation, children are less likely to engage in substance use <br> and other problem behaviors. |
| Rewards for <br> Prosocial <br> Involvement | Rewards for positive participation in activities help children bond <br> to the community, thus lowering their risk for substance use. |
| Family Domain Risk Factors |  |
| Poor Family <br> Management | Parents' use of inconsistent and/or unusually harsh or severe <br> punishment with their children places them at higher risk for <br> substance use and other problem behaviors. Also, parents' fail- <br> ure to provide clear expectations and to monitor their children's <br> behavior makes it more likely that they will engage in drug abuse <br> whether or not there are family drug problems. |
| Family History of <br> Antisocial Behavior <br> Children raised in families high in conflict, whether or not the <br>  <br> delinquency and drug use. |  |
| When children are raised in a family with a history of problem <br> behaviors (e.g., violence or ATOD use), the children are more <br> likely to engage in these behaviors. |  |

Risk and Protective Factor Scale Definition (continued)

| Parental Attitudes <br> Favorable Toward <br> Drug Use | In families where parents use illegal drugs, are heavy users of <br> alcohol, or are tolerant of children's use, children are more likely <br> to become drug abusers during adolescence. The risk is further <br> increased if parents involve children in their own drug (or alco- <br> hol) using behavior, for example, asking the child to light the <br> parent's cigarette or get the parent a beer from the refrigerator. |  |
| :--- | :--- | :---: |
| Parental Attitudes <br> Favorable Toward <br> Antisocial Behavior | In families where parents are tolerant of their child's antisocial <br> behavior (i.e. fighting, stealing, defacing property, etc.), chil- <br> dren are more likely to become drug abusers during adolescence. |  |
| Family Domain Protective Factors |  |  |
| Family Attachment | Young people who feel that they are a valued part of their family <br> are less likely to engage in substance use and other problem <br> behaviors. |  |
| Opportunities for <br> Prosocial <br> Involvement | Young people who are exposed to more opportunities to par- <br> ticipate meaningfully in the responsibilities and activities of the <br> family are less likely to engage in drug use and other problem <br> behaviors. |  |
| Rewards for Prosocial <br> Involvement | When parents, siblings, and other family members praise, en- <br> courage, and attend to things done well by their child, children <br> are less likely to engage in substance use and problem behaviors. |  |
| School Domain Risk Factors |  |  |
| Academic Failure | Beginning in the late elementary grades (grades 4-6) academic <br> failure increases the risk of both drug abuse and delinquency. It <br> appears that the experience of failure itself, for whatever reasons, <br> increases the risk of problem behaviors. |  |
| Low Commitment <br> to School | Surveys of high school seniors have shown that the use of hal- <br> lucinogens, cocaine, heroin, stimulants, and sedatives or non- <br> medically prescribed tranquilizers is significantly lower among <br> students who expect to attend college than among those who do <br> not. Factors such as liking school, spending time on homework, <br> and perceiving the coursework as relevant are also negatively <br> related to drug use. <br> School Domain Protective Factors |  |
| Opportunities for <br> Prosocial <br> Involvement | When young people are given more opportunities to participate <br> meaningfully in important activities at school, they are less likely <br> to engage in drug use and other problem behaviors. |  |
| Rewards for <br> Prosocial <br> Involvement | When young people are recognized and rewarded for their contri- <br> butions at school, they are less likely to be involved in substance <br> use and other problem behaviors. |  |

continued on the next column

Risk and Protective Factor Scale Definition (continued)

## ndividual/Peer Risk Factors

| Rebelliousness | Young people who do not feel part of society, are not bound by <br> rules, don't believe in trying to be successful or responsible, or <br> who take an active rebellious stance toward society, are at higher <br> risk of abusing drugs. In addition, high tolerance for deviance, <br> a strong need for independence and normlessness have all been <br> linked with drug use. |
| :--- | :--- |
| Early Initiation <br> of Drug Use | Early onset of drug use predicts misuse of drugs. The earlier the <br> onset of any drug use, the greater the involvement in other drug <br> use and the greater frequency of use. Onset of drug use prior to <br> the age of 15 is a consistent predictor of drug abuse, and a later <br> age of onset of drug use has been shown to predict lower drug <br> involvement and a greater probability of discontinuation of use. |
| Early Initiation <br> of Antisocial Behavior | Early onset of antisocial behaviors such as being suspended from <br> school, arrests, carrying handguns, fighting, etc. makes young <br> people more likely to be involved in substance abuse. |
| Attitudes Favorable | During the elementary school years, most children express anti- <br> drug, anti-crime, and pro-social attitudes and have difficulty <br> imagining why people use drugs. However, in middle school, <br> as more youth are exposed to others who use drugs, their atti- <br> tudes often shift toward greater acceptance of these behaviors. <br> Youth who express positive attitudes toward drug use are more <br> likely to engage in a variety of problem behaviors, including drug <br> use. |
| Attitudes Favorable | During the elementary school years, most children express anti- <br> drug, anti-crime, and pro-social attitudes and have difficulty <br> imagining why people engage in antisocial behaviors. How- <br> ever, in middle school, as more youth are exposed to others <br> who engage in antisocial behavior, their attitudes often shift to- <br> ward greater acceptance of these behaviors. Youth who express <br> positive attitudes toward antisocial behavior are more likely to <br> engage in a variety of problem behaviors, including antisocial <br> behavior. |
| Antisocial Behavior |  |

Risk and Protective Factor Scale Definition (continued)

| Risk and Protective Factor Scale Definition (continued) |  |  |
| :--- | :--- | :---: |
| Perceived Risk of <br> Drug Use | Young people who do not perceive drug use to be risky are far <br> more likely to engage in drug use. |  |
| Interaction with <br> Antisocial Peers | Young people who associate with peers who engage in problem <br> behaviors are at higher risk for engaging in antisocial behavior <br> themselves. |  |
| Friends' Use of Drugs | Young people who associate with peers who engage in alcohol or <br> substance abuse are much more likely to engage in the same be- <br> havior. Peer drug use has consistently been found to be among <br> the strongest predictors of substance use among youth. Even <br> when young people come from well-managed families and do not <br> experience other risk factors, spending time with friends who use <br> drugs greatly increases the risk of that problem developing. |  |
| Depressive <br> Symptoms | Young people who express feelings of sadness for long periods <br> over the past year and who have negative attitudes about them- <br> selves and life in general are more likely to use drugs. |  |
| Rewards for <br> Antisocial Behavior | Young people who receive rewards for their antisocial behavior <br> are at higher risk for engaging further in antisocial behavior and <br> substance use. |  |
| Individual/Peer Protective Factors |  |  |
| Religiosity | Young people who regularly attend religious services are less <br> likely to engage in problem behaviors. |  |
| Social Skills | Young people who are socially competent and engage in positive <br> interpersonal relations with their peers are less likely to use drugs <br> and engage in other problem behaviors. |  |
| Belief in the <br> Moral Order | Young people who have a belief in what is "right" or "wrong" <br> are less likely to use drugs. |  |
| Prosocial <br> Involvement | Participation in positive school and community activities helps <br> provide protection for youth. |  |
| Rewards for <br> Prosocial <br> Involvement | Young people who are rewarded for working hard in school and <br> volunteering in the community are less likely to engage in prob- <br> lem behavior. |  |

## 5 NO CHILD LEFT BEHIND PROFILE

The No Child Left Behind Profile looks specifically at student responses to the questions "How old were you when you first ...". The questions cover both first incidences of drug use (marijuana, cigarettes, alcohol, and regular use of alcohol) and first incidences of antisocial behaviors (suspension, arrest, carrying a gun, attacking someone and belonging to a gang). Possible responses to these questions range from age 10 to age 17 or the student can respond to the question with Never. The average age figures are based only on those students who responded to the question with an answer other than Never

## 6 STUDENT TOBACCO USE, EXPERIENCES AND PREVENTION SERVICES

Tobacco use is the leading preventable cause of death in the United States. The 2009 survey added four new tobacco-related questions (Q56-Q59) to the already existing items (Q52-Q55) to explore this topic.

Arkansas youth typically have higher rates of tobacco use, including both cigarettes and smokeless tobacco, than the national average. Higher tobacco prevalence rates are common across the Southeast United States. This is due to a variety of cultural and economic factors that have traditionally supported greater tobacco use. The following table shows the results of the lifetime and past 30 day use of cigarettes and chewing tobacco

Table 102: Cigarettes - Lifetime Use

## 7 DRUG-FREE COMMUNITIES SUPPORT PROGRAM CORE MEASURES

The Drug-Free Communities Support Program, administered by the Center for Substance Abuse Prevention, requests specific data which is typically referred to as the Core Measures. The drug categories measured are tobacco, alcohol and marijuana and the table is broken down by grade level. For each drug, and at each grade level, the percentage of students who responded positively to the question and the number of students who responded to the question are reported. For Age of Onset, the average age of first use for those students who reported using is reported.

Past 30-Day Use The question On how many occasions have you used ... in the past 30 days? is used to measure this statistic by reporting the percentage of students who report any use in the past 30 days.

Perception of Risk The question How much do you think people risk harming themselves if they ...? is used to measure this statistic by reporting the percentage of students who report that using the drug is a Moderate Risk or a Great Risk to their health.

Perception of Parental Disapproval The question How wrong do your parents feel it would be for you to ...? is used to measure this statistic by reporting the percentage of students who report that parents would feel it is Wrong or Very Wrong to use tobacco, alcohol and marijuana.

Age of Onset The question How old were you when you first...? is used to measure this statistic. The possible responses to this question range from 10 or Under to 17 or Older. The table shows the average age of onset of use of those students who answered the question with a response other than Never Used.
